Revised April 30, 2001 To Include ATC Values, Calculated By Linear Interpolation, For Identified Facility Overloads In Tables 5 and 9. This information was inadvertently left out of the initial System Impact Study.

1. Executive Summary

Energetix has requested a system impact study for long-term Firm Point-to-Point transmission service from Oklahoma Gas & Electric to Entergy. The period of the transaction is from 1/1/04 to 1/1/07. This is a 750MW request for the following reservations: 221104, 221106, 221107, and 221109-221114

The principal objective of this study is to identify system problems and potential system modifications necessary to facilitate the additional 750MW transfer while maintaining system reliability. New overloads caused by the 750MW transfer were determined along with monitoring any previously assigned facilities that were further overloaded by the transfer.

The previously requested Power Resource Group 670MW transfers from AEPW to Entergy and AEPW to Ameren are included in the models used for this study. The results of this analysis for the 750MW transfer are dependent on the completion of the upgrades assigned to these transmission requests, as well as the transmission projects that are proposed. These transmission requests and completed System Impact Studies are:

- ?? System Impact Study SPP-2000-108 for transmission request 212202, 670MW from AEPW to EES. The transmission projects proposed for this study are the Pittsburg to NW Texarkana to McNeil 500kV transmission line and the Dolet Hills to Coushatta 345kV transmission line. The details of these transmission lines are given in Table 1. These lines were proposed to relieve the facilities that were overloaded by the 670MW transfer from AEPW to EES and to improve system reliability.
- ?? System Impact Study SPP-2000-109 for transmission request 212203, 670MW from AEPW to AMRN. The transmission project proposed for this study is the Callaway to Montrose to La Cygne 345kV transmission line. The details of this line are given in Table 2. The line was proposed to expand the firm contract path capacity between SPP and AMRM and to improve system reliability. The line is necessary to provide the capacity needed for the 670MW transfer from AEPW to AMRN.

Using the updated models, an analysis was performed to determine the impact of the 750MW transfer on all SPP and Non-SPP facilities. Due to the facility overloads caused by the 750MW transfer, SPP proposes the addition of a 500kV transmission line connecting Muskogee to Arkansas Nuclear One. The analysis performed in the study shows that the addition of this transmission line relieves a majority of the overloaded facilities caused by the OKGE-EES 750MW transfer and improves system reliability.

2. Introduction

Energetix has requested an impact study for transmission service from OKGE control area with a sink of EES.

The principal objective of this study is to identify the restraints on the SPP Regional Tariff System that may limit the transfer too less than 750MW and to propose additional transmission projects that will relieve the overloads caused by the transfer.

The impact of the 750MW transfer on the system was initially studied with no additional proposed transmission projects included. The new facilities that were overloaded due to the 750MW transfer are documented. The Muskogee to ANO 500kV line was proposed to relieve constraints and provide system reliability. This project was included in the models and the impact of the 750MW transfer was again studied. The results of these analyses are given in the report.

This study includes steady-state contingency analyses (PSS/E function ACCC) which considers the impact of the 750MW transfer on transmission line loading and transmission bus voltages for outages of single and selected multiple transmission lines and transformers on the SPP system.

3. Study Methodology

A. Description

The steady-state analyses of the impact of the 750MW on SPP and Non-SPP facilities was done to ensure current SPP Criteria and NERC Planning Standards requirements are fulfilled. The Southwest Power Pool (SPP) conforms to the NERC Planning Standards, which provide the strictest requirements, related to thermal overloads with a contingency. It requires that all facilities be within emergency ratings after a contingency.

An analysis was first conducted to determine the impact of the 750MW on SPP and Non-SPP facilities. Any new facilities that were overloaded or any previously assigned facilities further impacted by the transfer were documented in the report.

Initially, an analysis was performed on the system without the addition of any new transmission projects to determine the overloads that were caused by the 750MW transfer. From this study, it was found that the OKGE to EES transfer caused several new overloads in the system, as well as further overloading facilities that had previously been assigned to other transmission customers. The addition of the proposed Muskogee (OKGE) to Arkansas Nuclear One (EES) relieves 33 overloaded SPP facilities while improving system reliability. The details of this line are given below:

Branch		Length	R	X	B	Rate A	Rate B
Muskogee – ANO	MSKGE8 500 to 8ANO 500	122 miles	0.00202	0.02762	2.67267	1732	1732

The facilities that were relieved due to the line addition are documented in Table 7. Though several of the overloaded SPP facilities were relieved by the 500kV line addition, some initial overloads caused by the transfer still exist. These remaining SPP facilities, which are given in Table 9, are required to be upgraded in order to provide the capacity needed to allow the 750MW transfer.

B. Model Updates

SPP used five seasonal models to study the 750MW request. The SPP 2000 Series Cases 2001 Spring Peak, 2004 Summer Peak, 2004/2005 Winter Peak, 2006 Summer Peak, and 2006/2007 Winter Peak were used to study the impact of the 750MW transfer on the SPP system during the transaction period of 1/1/04 to 1/1/07. The 2001 Spring Peak model is representative of the Spring Peaks throughout the length of the reservation.

Included in the models is the previously studied 670MW transfer from AEPW to EES and the 670MW transfer from AEPW to AMRN. The proposed transmission projects for these transmission requests are also included. These projects are the Pittsburg – NW Texarkana – McNeil 500kV line and the 345kV line from Dolet Hills to tap the Mt. Olive to Hartburg 500kV line and the Callaway – Montrose – La Cygne 345kV transmission line.

The chosen base case models were modified to reflect the most current modeling information. The cases were modified to reflect future firm transfers during the request period that were not already included in the January 2000 base case series models.

C. Transfer Analysis

Using the created models and the ACCC function of PSS|E, single and select double contingency outages were analyzed. Then full AC solution was used to obtain the most accurate results possible. Any facility overloaded, using MVA ratings, in the transfer case and not overloaded in the base case was flagged. The PSS/E options chosen to conduct the Impact Study analysis can be found in Appendix A.

4. Study Results

A. Study Analysis Results

The two 670MW transfers previously studied in System Impact Studies SPP-2000-108 and SPP-2000-109 are included in the models for this impact study. The transmission line projects that were proposed to provide the available capacity needed for these transactions are documented in Tables 1 and 2. In addition to the proposed transmission projects, the customer for these two previous studies is responsible for the necessary upgrades required to relieve the overloaded facilities found in Tables 3 and 4.

Tables 5, 6, 8, 7 and 9 document the results of the analyses performed for the 750MW transfer. The tables identify the seasonal case in which the event occurred, the emergency rating of the overloaded circuit (Rate B), the contingent loading percentage of circuit with and without the studied transfer or proposed line, the estimated ATC value using linear interpolation if calculated, any SPP identification or assignment of the event, and any solutions received from the transmission owners.

Tables 5 and 6 document the results of the initial analysis of the 750MW transfer. The initial analysis was performed on the system without the addition of the Muskogee to ANO 500kV transmission line. Table 5 details the SPP facilities that were overloaded due to the 750MW transfer from OKGE to EES. The Non-SPP facilities overloaded by this transfer are shown in Table 6.

After determining the new overloads caused by the 750MW transfer, the proposed 500kV line was added to the system. Tables 7 and 8 document the new facility overloads found in Table 5 and 6 relieved by the addition of the Muskogee to ANO 500kV line. It was found that 33 SPP facilities that were overloaded by the 750MW transfer were relieved with the 500kV line addition. These facilities are given in Table 7. Table 8 shows the Non-SPP facilities relieved by the transmission line.

Though the addition of the new transmission line project relieved several of the overloads caused by the 750MW transfer, some facilities still remain overloaded. The facilities, outlined in Table 9, are required to be upgraded prior to the approval of the 750MW transfer.

5. Conclusion

The results of the study show that before the 750MW transfer from OKGE to EES can take place system improvements will be needed.

1. The study of the 750MW transfer is contingent on the two previous studies that were discussed. These are SPP System Impact Studies SPP-2000-108 and SPP-2000-109. SPP-2000-108 is the study of OASIS Reservation 212202 requesting 670MW from AEPW to EES. Proposed in this study is the addition of the Pittsburg to NW Texarkana to McNeil 500kV line and Dolet Hills to Coushatta 345kV line. This line is also included in the Impact Study SPP-2000-109, which is the study of OASIS Reservation 212203 requesting 670MW from AEPW to Ameren. Proposed in this study is the addition of the Callaway to Montrose to La Cygne 345kV line, which is included to increase the SPP to Ameren Contract Path Capacity. The study of the 750MW from OKGE to EES assumes that these transfers will exist and the construction of the proposed transmission lines will be completed.
2. As shown in Table 5, the 750MW transfer from OKGE to EES causes overloads on facilities that have not been previously assigned. These new overloads must be relieved in order to provide the capacity needed for the transaction. SPP proposes the addition of a 500kV line from Muskogee to Arkansas Nuclear One. The addition of this line helps maintain and improve system reliability and also relieves 33 SPP facility overloads caused by the 750MW transfer.
3. The new overloads that were not relieved by the addition of the 500kV line must be upgraded. These facilities are included in Table 9.

The 750MW transfer from OKGE to EES, requested by Energetix is dependant on the completion of the additions and upgrades from the two previous studies that are listed in Tables 1 thru 4, along with any remaining facilities that have been previously assigned to other customers.

The final cost assignment of facilities and ATC to Energetix will be determined upon the completion of a facility study.

Appendix A

PSS/E CHOICES IN RUNNING LOAD FLOW PROGRAM AND ACCC

BASE CASES:

Solutions - Fixed slope decoupled Newton-Raphson solution (FDNS)

1. Tap adjustment – Stepping
2. Area interchange control – Tie lines only
3. Var limits – Apply immediately
4. Solution options - X Phase shift adjustment
 - _ Flat start
 - _ Lock DC taps
 - _ Lock switched shunts

ACCC CASES:

Solutions – AC contingency checking (ACCC)

1. MW mismatch tolerance –1.0
2. Contingency case rating – Rate B
3. Percent of rating – 100
4. Output code – Summary
5. Min flow change in overload report – 1mw
6. Excl cases w/ no overloads form report – YES
7. Exclude interfaces from report – NO
8. Perform voltage limit check – YES
9. Elements in available capacity table – 60000
10. Cutoff threshold for available capacity table – 99999.0
11. Min. contng. case Vltg chng for report – 0.02
12. Sorted output – None

Newton Solution:

1. Tap adjustment – Stepping
2. Area interchange control – Tie lines only
3. Var limits - Apply automatically
4. Solution options - X Phase shift adjustment
 - _ Flat start
 - _ Lock DC taps
 - _ Lock switched shunts
