## Executive Summary

Generation Interconnection customers have requested a Definitive Interconnection System Impact Study (DISIS) under the Generation Interconnection Procedures (GIP) in the Southwest Power Pool Open Access Transmission Tariff (OATT). The Interconnection Customers' requests have been clustered together for the following Impact Cluster Study. This Impact Study analyzes the interconnecting of multiple generation interconnection requests associated with new generation totaling approximately 2,262 MW of new generation which would be located within the transmission systems of Midwest Energy Inc. (MIDW), Mid-Kansas Electric Power LLC (MKEC), Missouri Public Service (MIPU), Nebraska Public Power District (NPPD), Oklahoma Gas and Electric (OKGE), Omaha Public Power District (OPPD), Southwestern Public Service (SPS), Sunflower Electric Power Corporation (SUNC), Westar Energy (WERE) and Western Farmers Electric Cooperative (WFEC). The various generation interconnection requests have differing proposed in-service dates<sup>1</sup>. The generation interconnection requests included in this Impact Cluster Study are listed in Appendix A by their queue number, amount, requested interconnection service, area, requested interconnection point, proposed interconnection point, and the requested in-service date. This restudy was performed to account for withdrawals within the DISIS-2010-001 study as well as higher queued projects withdrawing.

Power flow analysis has indicated that for the power flow cases studied 2,262 MW of nameplate generation may be interconnected with transmission system reinforcements within the SPP transmission system. Dynamic Stability and power factor analysis has determined the need for reactive compensation in accordance with Order No. 661-A for wind farm interconnection requests and those requirements are listed for each interconnection request within the contents of this report.

Dynamic Stability Analysis has determined that the transmission system will remain stable with the assigned Network Upgrades and necessary reactive compensation requirements.

The total estimated minimum cost for interconnecting the DISIS-2010-002 interconnection customers is \$261,000,000. These costs are shown in Appendix E and F. Interconnection Service to DISIS-2010-002 interconnection customers is also contingent upon higher queued customers paying for certain required network upgrades. The in service date for the DISIS customers will be deferred until the construction of these network upgrades can be completed.

These costs do not include the Interconnection Customer Interconnection Facilities as defined by the SPP Open Access Transmission Tariff (OATT). This cost does not include additional network constraints in the SPP transmission systems that were identified as shown in Appendix H.

Network Constraints listed in Appendix H are in the local area of the new generation when this generation is injected throughout the SPP footprint for the Energy Resource (ER) Interconnection Request. Certain Interconnection Requests were studied for Network Resource Interconnection Service (NR). Those constraints are listed in Appendix H. Additional Network constraints will have to be verified with a Transmission Service Request (TSR) and associated studies. With a defined source and sink in a TSR, this list of Network Constraints will be refined and expanded to account for all Network Upgrade requirements.

<sup>1</sup> The generation interconnection requests in-service dates will need to be deferred based on the required lead time for the Network Upgrades necessary. The Interconnection Customer's that proceed to the Facility Study will be provided a new in-service date based on the competition of the Facility Study.

The required interconnection costs listed in Appendix E and F do not include all costs associated with the deliverability of the energy to final customers. These costs are determined by separate studies if the Customer submits a Transmission Service Request through SPP's Open Access Same Time Information System (OASIS) as required by Attachment Z1 of the SPP OATT.

## Introduction

---

Pursuant to the Southwest Power Pool (SPP) Open Access Transmission Tariff (OATT), SPP has conducted this Definitive Interconnection System Impact Study (DISIS) for certain generation interconnection requests in the SPP Generation Interconnection Queue. These interconnection requests have been clustered together for the following Impact Study. The customers will be referred to in this study as the DISIS-2010-002 Interconnection Customers. This Impact Study analyzes the interconnecting of multiple generation interconnection requests associated with new generation totaling 2,262 MW of new generation which would be located within the transmission systems of Midwest Energy Inc. (MIDW), Mid-Kansas Electric Power LLC (MKEC), Missouri Public Service (MIPU), Nebraska Public Power District (NPPD), Oklahoma Gas and Electric (OKGE), Omaha Public Power District (OPPD), Southwestern Public Service (SPS), Sunflower Electric Power Corporation (SUNC), Westar Energy (WERE) and Western Farmers Electric Cooperative (WFEC). The various generation interconnection requests have differing proposed in-service dates<sup>2</sup>. The generation interconnection requests included in this Impact Study are listed in Appendix A by their queue number, amount, requested interconnection service, area, requested interconnection point, proposed interconnection point, and the requested in-service date. This restudy was performed to account for withdrawals within the DISIS-2010-001 study as well as higher queued projects withdrawing.

The primary objective of this Definitive Interconnection System Impact Study is to identify the system constraints associated with connecting the generation to the area transmission system. The Impact and other subsequent Interconnection Studies are designed to identify attachment facilities, Network Upgrades and other Direct Assignment Facilities needed to accept power into the grid at each specific interconnection receipt point.

---

## Model Development

---

### Interconnection Requests Included in the Cluster

SPP has included all interconnection requests that submitted a Definitive Interconnection System Impact Study request no later than September 30, 2010 and were subsequently accepted by Southwest Power Pool under the terms of the Generator Interconnection Procedures (GIP) that became effective March 30, 2010.

Affected System Interconnection Requests - Also included in this Definitive Impact Study are three Affected System Studies, all of the requests are on the Lea County Electric Cooperative system in Lea County, New Mexico. The Affected System Studies have been given the designation ASGI-2010-020 (Tatum – Crossroads 69kV), ASGI-2010-021 (Saunders – Anderson 69kV), and ASGI-2011-001 (Lovington 115kV) respectively.

The interconnection requests that are included in this study are listed in Appendix A.

---

<sup>2</sup> The generation interconnection requests in-service dates will need to be deferred based on the required lead time for the Network Upgrades necessary. The Interconnection Customer's that proceed to the Facility Study will be provided a new in-service date based on the competition of the Facility Study.

## Previous Queued Projects

The previous queued projects included in this study are listed in Appendix B. In addition to the Base Case Upgrades, the previous queued projects and associated upgrades were assumed to be in-service and added to the Base Case models. These projects were dispatched as Energy Resources with equal distribution across the SPP footprint.

## Development of Base Cases

**Power flow** - The 2010 series Transmission Service Request (TSR) Models 2011 spring, 2012 summer and winter, and 2016 summer and winter scenario 0 peak cases were used for this study. After the cases were developed, each of the control areas' resources were then re-dispatched using current dispatch orders.

**Stability** – The 2010 series SPP Model Development Working Group (MDWG) Models 2011 winter and 2011 summer were used for this study.

## Base Case Upgrades

The following facilities are part of the SPP Transmission Expansion Plan or the Balanced Portfolio or recently approved Priority Projects. These facilities have been approved or are in construction stages and were assumed to be in-service at the time of dispatch and added to the base case models. The DISIS-2010-002 Customers have not been assigned cost for the below listed projects. The DISIS-2010-002 Customers Generation Facilities in service dates may need to be delayed until the completion of the following upgrades. If for some reason, construction on these projects is discontinued, additional restudies will be needed to determine the interconnection needs of the DISIS customers.

- Hitchland 345/230/115kV upgrades to be built by SPS for 2010/2011 in-service<sup>3</sup>.
  - Hitchland – Moore County 230kV line
  - Hitchland – Perryton 230kV line
  - Hitchland – Texas County 115kV line
  - Hitchland – Hansford County 115kV line
  - Hitchland – Sherman County Tap 115kV line
- Valliant – Hugo – Sunnyside 345kV – assigned to Aggregate Study AG3-2006 Customers
- Wichita – Reno County – Summit 345kV to be built by WERE<sup>4</sup>.
- Rose Hill – Sooner 345kV to be built by WERE/OKGE.
- Knob Hill – Steele City 115kV to be built by NPPD/WERE.
- Balanced Portfolio Projects<sup>5</sup>:
  - Gracemont 345/138/13.2kV Autotransformer
  - Woodward– Tuco 345kV line
  - Iatan– Nashua 345kV line
  - Muskogee– Seminole 345kV line
  - Post Rock– Axtell 345kV line
  - Spearville– Post Rock 345kV line

---

<sup>3</sup> Approved 230kV upgrades are based on SPP 2007 STEP. Upgrades may need to be re-evaluated in the system impact study.

<sup>4</sup> Approved based on an order of the Kansas Corporation Commission issued in Docket no. 07-WSEE-715-MIS

<sup>5</sup> Notice to Construct (NTC) issued June, 2009

- Tap Stillwell – Swissvale 345kV line at West Gardner
- Priority Projects<sup>6</sup>:
  - Hitchland - Woodward double circuit 345kV
  - Woodward – Medicine Lodge double circuit 345kV
  - Spearville – Comanche (Clark) double circuit 345kV
  - Comanche (Clark) – Medicine Lodge double circuit 345kV
  - Medicine Lodge – Wichita double circuit 345kV
  - Medicine Lodge 345/138kV autotransformer

## Contingent Upgrades

The following facilities do not yet have approval. These facilities have been assigned to higher queued interconnection customers. These facilities have been included in the models for the DISIS-2010-002 study and are assumed to be in service. The DISIS-2010-002 Customers at this time do not have responsibility for these facilities but may later be assigned the cost of these facilities if higher queued customers terminate their GIA or withdraw from the interconnection queue. The DISIS-2010-002 Customer Generation Facilities in service dates may need to be delayed until the completion of the following upgrades.

- Finney – Holcomb 345kV Ckt #2 line assigned to GEN-2006-044 interconnection customer. This customer is currently in suspension<sup>7</sup>.
- Central Plains – Setab 115kV transmission line assigned to GEN-2007-013 interconnection customer.
- Spearville 345/115kV autotransformer #2 assigned to 1<sup>st</sup> Cluster Interconnection Customers
- Grassland 230/115kV autotransformer #2 assigned to 1<sup>st</sup> Cluster Interconnection Customers (100% to GEN-2008-016)
- Judson Large – North Judson Large – Spearville Ckt #2 assigned to DISIS-2009-001-1 Interconnection Customers (100% to GEN-2008-079)
- Hitchland – Wheeler (Border) single circuit 345kV assigned to DISIS-2010-001 Interconnection Customers
- Madison County 230/115kV autotransformer #1 assigned to DISIS-2010-001 Interconnection Customer
- Norfolk – Madison County Tap 115kV Ckt #1 assigned to DISIS-2010-001 Interconnection Customers

---

<sup>6</sup> Notice to Construct (NTC) issued June, 2010. NTC for double circuit lines indicated that NTC may be revised at a later time to be built at a higher voltage.

<sup>7</sup> Based on Facility Study Posting November 2008

- Washita – Gracemont 138kV Ckt #2 assigned to DISIS-2010-001 Interconnection Customers
- Post Rock 345/230kV autotransformer #2 assigned to DISIS-2010-001 Interconnection Customers
- GEN-2008-079 Tap – Spearville 115kV Ckt #1 assigned to DISIS-2010-001 Interconnection Customers

## Potential Upgrades Not in the Base Case

Any potential upgrades that do not have a Notification to Construct (NTC) have not been included in the base case. These upgrades include any identified in the SPP Extra-High Voltage (EHV) overlay plan, or any other SPP planning study other than the upgrades listed above in the previous section.

## Regional Groupings

The interconnection requests listed in Appendix A were grouped together in ten different regional groups based on geographical and electrical impacts. These groupings are shown in Appendix C.

To determine interconnection impacts, ten different dispatch variations of the spring base case models were developed to accommodate the regional groupings.

**Power flow** - For each group, the various wind generating plants were modeled at 80% nameplate of maximum generation. The wind generating plants in the other areas were modeled at 20% nameplate of maximum generation. This process created ten different scenarios with each group being studied at 80% nameplate rating. These projects were dispatched as Energy Resources with equal distribution across the SPP footprint. Certain projects that requested Network Resource Interconnection Service were dispatched in an additional analysis into the balancing authority of the interconnecting transmission owner. This method allowed for the identification of network constraints that were common to the regional groupings that could then in turn have the mitigating upgrade cost allocated throughout the entire cluster. Each interconnection request was also modeled separately at 100% nameplate for certain analyses.

Peaking units were not dispatched in the 2011 spring model. To study peaking units' impacts, the 2012 and 2016 summer peak model was chosen and peaking units were modeled at 100% of the nameplate rating and wind generating facilities were modeled at 10% of the nameplate rating. Each interconnection request was also modeled separately at 100% nameplate for certain analyses.

## Identification of Network Constraints

The initial set of network constraints were found by using PTI MUST First Contingency Incremental Transfer Capability (FCITC) analysis on the entire cluster grouping dispatched at the various levels mentioned above. These constraints were then screened to determine if any of the generation interconnection requests had at least a 20% Distribution Factor (DF) upon the constraint. Constraints that measured at least a 20% DF from at least one interconnection request were considered for mitigation. Interconnection Requests that were being studied for Network Resource Interconnection Service were studied in the additional NRIS analysis to determine if any constraint had at least a 3% DF. If so, these constraints were considered for mitigation.

## Determination of Cost Allocated Network Upgrades

Cost Allocated Network Upgrades of wind generation interconnection requests were determined using the 2011 spring model. Cost Allocated Network Upgrades of peaking units was determined using the 2016 summer peak model. Once a determination of the required Network Upgrades was made, a power flow model of the 2011 spring case was developed with all cost allocated Network Upgrades in-service. A MUST FCITC analysis was performed to determine the distribution factor with no contingency that each generation interconnection request had on each new upgrade. The impact each generation interconnection request had on each upgrade project was weighted by the size of each request. Finally the costs due by each request for a particular project were then determined by allocating the portion of each request's impact over the impact of all affecting requests.

For example, assume that there are three Generation Interconnection requests, X, Y, and Z that are responsible for the costs of Upgrade Project '1'. Given that their respective DF for the project have been determined, the cost allocation for Generation Interconnection request 'X' for Upgrade Project 1 is found by the following set of steps and formulas:

- Determine an Impact Factor on a given project for all responsible GI requests:

$$\text{Request X Impact Factor on Upgrade Project 1} = \text{DF}(\%)(X) * \text{MW}(X) = X_1$$

$$\text{Request Y Impact Factor on Upgrade Project 1} = \text{DF}(\%)(Y) * \text{MW}(Y) = Y_1$$

$$\text{Request Z Impact Factor on Upgrade Project 1} = \text{DF}(\%)(Z) * \text{MW}(Z) = Z_1$$

- Determine each request's Allocation of Cost for that particular project:

$$\text{Request X's Project 1 Cost Allocation} (\$) = \frac{\text{Network Upgrade Project 1 Cost} (\$) * X_1}{X_1 + Y_1 + Z_1}$$

- Repeat previous for each responsible GI request for each Project

The cost allocation of each needed Network Upgrade is determined by the size of each request and its impact on the given project. This allows for the most efficient and reasonable mechanism for sharing the costs of upgrades.

**Credits for Amounts Advanced for Network Upgrades** - Interconnection Customer shall be entitled to credits in accordance with Attachment Z1 of the SPP Tariff for any Network Upgrades including any tax gross-up or any other tax-related payments associated with the Network Upgrades, and not refunded to the Interconnection Customer.

## Interconnection Facilities

The requirement to interconnect the 2,262 MW of generation into the existing and proposed transmission systems in the affected areas of the SPP transmission footprint consist of the necessary cost allocated shared facilities listed in Appendix F by upgrade. The interconnection requirements for the cluster total \$261,000,000. Interconnection Facilities specific to each generation interconnection request are listed in Appendix E.

A list of constraints with greater than or equal to a 20% OTDF that were identified and used for mitigation is listed in Appendix G. Other Network Constraints in the MIDW, MKEC, MIPU, NPPD, OKGE, OPPD, SPS, SUNC, WERE and WFEC transmission systems that were identified are shown in Appendix H. With a defined source and sink in a TSR, this list of Network Constraints will be refined and expanded to account for all Network Upgrade requirements.

A preliminary one-line drawing for each generation interconnection request are listed in Appendix D. Figure 1 depicts the major transmission line Network Upgrades needed to support the interconnection of the generation amounts requested in this study.

## Power flow

### Power flow Analysis Methodology

The Southwest Power Pool (SPP) Criteria states that:

“The transmission system of the SPP region shall be planned and constructed so that the contingencies as set forth in the Criteria will meet the applicable *NERC Reliability Standards* for transmission planning. All MDWG power flow models shall be tested to verify compliance with the System Performance Standards from NERC Table 1 – Category A.”

The ACCC function of PSS/E was used to simulate single contingencies in portions or all of the modeled control areas of Midwest Energy Inc. (MIDW), Mid-Kansas Electric Power LLC (MKEC), Missouri Public Service (MIPU), Nebraska Public Power District (NPPD), Oklahoma Gas and Electric (OKGE), Omaha Public Power District (OPPD), Southwestern Public Service (SPS), Sunflower Electric Power Corporation (SUNC), Westar Energy (WERE), Western Farmers Electric Cooperative (WFEC) and other control areas were applied and the resulting scenarios analyzed. This satisfies the “more probable” contingency testing criteria mandated by NERC and the SPP criteria.

### Power flow Analysis

A power flow analysis was conducted for each Interconnection Customer’s facility using modified versions of the 2011 (spring) peak, 2012 (summer and winter), and the 2016 (summer and winter) peak models. The output of the Interconnection Customer’s facility was offset in each model by a reduction in output of existing online SPP generation. This method allows the request to be studied as an Energy Resource (ER) Interconnection Request. The available seasonal models used were through the 2016 Winter Peak. Certain requests that requested Network Resource Interconnection

Service (NRIS) had an additional analysis conducted for sinking the energy in the interconnecting Transmission Owner's balancing authority.

This analysis was conducted assuming that previous queued requests in the immediate area of these interconnect requests were in-service. The analysis of the each Customer's project indicates that additional criteria violations will occur on the MIDW, MKEC, MIPU, NPPD, OKGE, OPPD, SPS, SUNC, WERE and WFEC transmission systems under steady state and contingency conditions in the peak seasons.

### **Cluster Group 1 (Woodward Area)**

The Woodward group had 320 MW of interconnection requests in addition to the 3,344.2 MW of previously queued generation in the area. FPL Switch – Woodward 138kV rebuild is necessary for overloads experienced by Mooreland – Woodward 345kV and Mooreland 345/138kV transformer constraints. Stability Analysis indicated that the Beaver County – Gray County 345kV line may be necessary for interconnection.

### **Cluster Group 2 (Hitchland Area)**

The Hitchland group had 300 MW of interconnection requests in addition to the 2,714.7 MW of previously queued generation in the area. With the withdrawal of higher queued projects, no constraints were found to need mitigating. The Group 2 Interconnection Requests are dependent upon the higher queued upgrade, Hitchland-Border 345kV. If higher queued requests withdraw, a subsequent restudy will be required to determine the Group 2 cost responsibility for this upgrade. .

### **Cluster Group 3 (Spearville Area)**

The Spearville group had 748.5 MW of interconnection requests in addition to the 2,697.4 MW of previously queued generation in the area. Voltage collapse was observed for outage of the Hitchland-Stevens County 345kV line. Stability Analysis indicated instability as well. A 345kV line from the Beaver County - Gray County tap point was necessary to alleviate the constraint. Local area constraints in the area of GEN-2010-049 were also observed including the St. John (MKEC) – St. John (MIDW) 115kV line, Huntsville- St John 115kV and an additional Medicine Lodge autotransformer.

### **Cluster Group 4 (Mingo/NW Kansas Group)**

The Mingo/NW Kansas group had 0 MW of interconnection requests in addition to the 924.2 MW of previously queued generation in the area. No new constraints were found in this area.

### **Cluster Group 5 (Amarillo Area)**

The Amarillo group had 0 MW of interconnection requests in addition to the 2,132.6 MW of previously queued generation in the area. No new constraints were found in this area.

### **Cluster Group 6 (South Panhandle/New Mexico)**

The South Panhandle/New Mexico group had 142.6 MW of interconnection requests in addition to the 2,017 MW of previously queued generation in the area. The entire section from Lovington – Reed – McDonald – Tatum – ASGI-2010-020 will need to be rebuilt due to overloads caused by the ASGI-2010-020 affected system interconnection request.

### **Cluster Group 7 (Southwestern Oklahoma)**

The Southwestern Oklahoma group had 65 MW of interconnection requests in addition to the 1,995 MW of previously queued generation in the area. The Clinton Junction – Elk City 138kV line will need to be rebuilt due to overloads caused by the GEN-2010-012 interconnection request.

**Cluster Group 8 (South Central Kansas/North Oklahoma)**

The South Central Kansas/North Oklahoma group had 0 MW of interconnection requests in addition to the 3,351.5 MW of previously queued generation in the area. No new constraints were found in this area.

**Cluster Group 9 (Northeast Nebraska)**

The Northeast Nebraska group had 200 MW of interconnection requests in addition to the 648.5 MW of previously queued generation in the area. Examination by the Transmission Owner has determined that line clearances will need to be raised to accommodate the interconnection of the Group 9 generator.

**Cluster Group 10 (North Nebraska)**

The North Nebraska group had 0 MW of interconnection requests in addition to the 356.2 MW of previously queued generation in the area. No new constraints were found in this area

**Cluster Group 11 (North Kansas)**

The North Kansas group had 70 MW of interconnection requests in addition to the 1,297.9 MW of previously queued generation in the area. The interconnection request in Group 11 contributed to the voltage stability issue at Spearville and is assigned a portion of the Beaver-Gray 345kV line. Overloads on the Clifton – Green Leaf 115kV and Greenleaf – Knob Hill lines were observed. This overload will be mitigated by the addition of the Steele City – Knob Hill in the Expansion Plan.

**Cluster Group 12 (Northwest Arkansas)**

The Northwest Arkansas group had 0 MW of interconnection requests in addition to the 0 MW of previously queued generation in the area. No new constraints were found in this area.

**Cluster Group 13 (Northwest Missouri)**

The North Missouri group had 87.1 MW of interconnection requests in addition to the 2,036.5 MW of previously queued generation in the area. The GEN-2010-047 – Harbine 115kV line will need to be rebuilt due to overloads caused by the GEN-2010-047 interconnection request.

**Cluster Group 14 (South Central Oklahoma)**

The South Central Oklahoma group had 300 MW of interconnection requests in addition to the 950MW of previously queued generation in the area. An additional Northwest 345/138/13.8kV transformer will need to be installed for the overload caused by GEN-2010-040 NRIS service.

**Cluster Group 15 (Southwest Nebraska)**

The Southwest Nebraska group had 0 MW of interconnection requests in addition to the 89.7 MW of previously queued generation in the area. No new constraints were found in this area.

# Stability Analysis

A stability analysis was conducted for each Interconnection Customer's facility using modified versions of the 2011 summer and 2011 winter peak models. The stability analysis was conducted with all upgrades in service that were identified in the power flow analysis. For each group, the interconnection requests were studied at 100% nameplate output while the other groups were dispatched at 20% output for wind requests and 100% output for fossil requests. The output of the Interconnection Customer's facility was offset in each model by a reduction in output of existing online SPP generation. The following synopsis is included for each group. The entire stability study for each group can be found in the Appendices.

## **Cluster Group 1 (Woodward Area)**

The Group 1 stability analysis was not performed again for this restudy.

## **Cluster Group 2 (Hitchland Area)**

The Group 2 stability analysis was not performed again for this restudy.

## **Cluster Group 3 (Spearville Area)**

The Group 3 stability analysis was not performed again for this restudy.

## **Cluster Group 4 (Mingo Area)**

There was no stability analysis conducted in the Mingo area due to no requests in the area.

## **Cluster Group 5 (Amarillo Area)**

There was no stability analysis conducted in the Amarillo area due to no requests in the area.

## **Cluster Group 6 (South Panhandle Area)**

The Group 6 stability analysis was not performed again for this restudy.

## **Cluster Group 7 (Southwest Oklahoma Area)**

The Group 7 stability analysis was not performed again for this restudy.

## **Cluster Group 8 (South Central Kansas Area)**

There was no stability analysis conducted in the South Central Kansas area due to no requests in the area.

## **Cluster Group 9 (Northeast Nebraska Area)**

The Group 9 stability analysis was not performed again for this study.

## **Cluster Group 10 (North Nebraska Area)**

There was no stability analysis conducted in the Southwest Nebraska area due to no requests in the area.

## **Cluster Group 11 (North Kansas Area)**

The Group 11 stability analysis was not performed again for this study.

### **Cluster Group 12 (Northwest Arkansas Area)**

There was no stability analysis conducted in the Northwest Arkansas area due to no requests in the area.

### **Cluster Group 13 (Northwest Missouri Area)**

### **Cluster Group 14 (South Central Oklahoma)**

The Group 14 stability analysis was not performed again for this study

### **Cluster Group 15 (Southwest Nebraska Area)**

There was no stability analysis conducted in the Southwest Nebraska area due to no requests in the area.

## Conclusion

The minimum cost of interconnecting all of the interconnection requests included in the Definitive Interconnection System Impact Study is estimated at \$261,000,000 for the Allocated Network Upgrades and Transmission Owner Interconnection Facilities are listed in Appendix E and F.

The required interconnection costs listed in Appendices E, and F, and other upgrades associated with Network Constraints do not include all costs associated with the deliverability of the energy to final customers. These costs are determined by separate studies if the Customer submits a Transmission Service Request (TSR) through SPP's Open Access Same Time Information System (OASIS) as required by Attachment Z1 of the SPP Open Access Transmission Tariff (OATT).

---

## **Appendix**
