## Executive Summary

Generation Interconnection customers have requested a Feasibility Study under the Generation Interconnection Procedures (GIP) in the Southwest Power Pool Open Access Transmission Tariff (OATT). The Interconnection Customers' requests have been clustered together for the following Feasibility Cluster Study. This Feasibility Cluster Study analyzes the interconnecting of multiple generation interconnection requests associated with new generation totaling approximately 350.2 MW of new generation which would be located within the transmission systems of Nebraska Public Power District (NPPD) and Sunflower Electric Power Corporation (SUNC). The various generation interconnection requests have differing proposed in-service dates<sup>1</sup>. The generation interconnection requests included in this Feasibility Cluster Study are listed in Appendix A by their queue number, amount, area, requested interconnection point, proposed interconnection point, and the requested in-service date.

Power flow analysis has indicated that for the powerflow cases studied, 350.2 MW of nameplate generation may be interconnected with transmission system reinforcements within the SPP transmission system. The need for reactive compensation in accordance with Order No. 661-A for wind farm interconnection requests will be evaluated in the Interconnection System Impact Study based on the wind turbine manufacturer and type requested by the Customer. Dynamic stability studies performed as part of the System Impact Cluster Study will provide additional guidance as to whether the required reactive compensation can be static or a portion must be dynamic (such as a SVC).

The total estimated minimum cost for interconnecting the studied generation interconnection request is \$119,000,000. These costs are shown in Appendix E. These costs do not include the Interconnection Customer Interconnection Facilities as defined by the SPP Open Access Transmission Tariff (OATT). This cost does not include the possible need for reactive compensation or additional interconnection facilities or network upgrades that may be identified through additional analyses performed in the Preliminary Interconnection System Impact Study (PISIS).

Network Constraints listed in Appendix F are in the local area of the new generation when this generation is injected throughout the SPP footprint for the Energy Resource (ER) Interconnection Request. Certain interconnection requests have been studied for Network Resource (NR) Interconnection Service. Additional Network constraints will have to be verified with a Transmission Service Request (TSR) and associated studies. With a defined source and sink in a TSR, this list of Network Constraints will be refined and expanded to account for all Network Upgrade requirements.

The required interconnection costs listed in Appendix E does not include all costs associated with the deliverability of the energy to final customers. These costs are determined by separate studies if the Customer submits a Transmission Service Request through SPP's Open Access Same Time Information System (OASIS) as required by Attachment Z1 of the SPP OATT.

Based on the SPP Tariff Attachment O, transmission facilities that are part of the SPP Transmission Expansion Plan (STEP) including Sponsored Economic Upgrades or the Balanced Portfolio that

<sup>1</sup> The generation interconnection requests in-service dates will need to be deferred based on the required lead time for the Network Upgrades necessary. The Interconnection Customer's that proceed to the Facility Study will be provided a new in-service date based on the competition of the Facility Study.

may be approved by the SPP Board of Directors will receive notifications to construct. These projects will then be considered construction pending projects and would not be assignable to the Feasibility Cluster Study Generation Interconnection Requests. The network Upgrades identified in the Base Case Upgrades will not be assigned to the Feasibility Cluster Study for Generation Interconnection Requests.

## Introduction

---

Generation Interconnection customers have requested a Feasibility Study under the Generation Interconnection Procedures (GIP) in the Southwest Power Pool Open Access Transmission Tariff (OATT). The Interconnection Customers' requests have been clustered together for the following Feasibility Cluster Study. This Feasibility Cluster Study analyzes the interconnecting of multiple generation interconnection requests associated with new generation totaling approximately 350.2 MW of new generation which would be located within the transmission systems of Nebraska Public Power District (NPPD) and Sunflower Electric Power Corporation (SUNC). The various generation interconnection requests have differing proposed in-service dates<sup>2</sup>. The generation interconnection requests included in this Feasibility Cluster Study are listed in Appendix A by their queue number, amount, area, requested interconnection service, requested interconnection point, proposed interconnection point, and the requested in-service date.

The primary objective of this Feasibility Cluster Study is to identify the system constraints associated with connecting the generation to the area transmission system. The Feasibility and other subsequent Interconnection Studies are designed to identify attachment facilities, Network Upgrades and other Direct Assignment Facilities needed to accept power into the grid at each specific interconnection receipt point.

---

## Model Development

---

**Interconnection Requests Included in the Cluster** – SPP has included the interconnection requests listed in Appendix A to be analyzed in this cluster study. These interconnection requests represent requests with an executed Feasibility Study Agreement signed by 9/30/2010.

**Electrically Isolated Interconnection Requests** – Electrically isolated requests are discussed in the “Regional Groupings” section.

**Previous Queued Projects** - The previous queued projects included in this study are listed in Appendix B. In addition to the Base Case Upgrades, the previous queued projects were assumed to be in-service and added to the Base Case models. These projects were dispatched as Energy Resources with equal distribution across the SPP footprint.

**Development of Base Cases** - The 2010 series Transmission Service Request (TSR) Models 2011 spring, summer, and winter scenario 0 peak cases were used. Also, the 2016 summer and winter scenario 0 peak cases were used for this study. After the 2011 and 2016 cases were developed, each of the control areas' resources were then redispatched using current dispatch orders.

---

<sup>2</sup> The generation interconnection requests in-service dates will need to be deferred based on the required lead time for the Network Upgrades necessary. The Interconnection Customer's that proceed to the Facility Study will be provided a new in-service date based on the competition of the Facility Study.

**Base Case Upgrades** - The following facilities are part of the SPP Transmission Expansion Plan, Balanced Portfolio, or High Priority Projects. These facilities have been approved or are in the construction stages and were assumed to be in-service at the time of dispatch and added to the base case models. The FCS-2010-004 Customers do not have cost for the below listed projects. However, the FCS-2010-004 Customer Generation Facilities in service dated may need to be delayed until the completion of the following upgrades. If for some reason, construction on these projects is discontinued, additional restudies will be needed to determine the interconnection needs of the FCS-2010-004 customers.

- Hitchland 345/230/115kV upgrades to be built by SPS for 2010/2011 in-service<sup>3</sup>.
  - Hitchland – Moore County 230kV line
  - Hitchland – Perryton 230kV line
  - Hitchland – Texas County 115kV line
  - Hitchland – Hansford County 115kV line
  - Hitchland – Sherman County Tap 115kV line
- Valliant – Hugo – Sunnyside 345kV – assigned to Aggregate Study AG3-2006 Customers for 2012 in-service
- Wichita – Reno County – Summit 345kV to be built by WERE for 2010 in-service<sup>4</sup>.
- Rose Hill – Sooner 345kV to be built by WERE/OKGE for 2013 in-service.
- Knob Hill – Steele City 115kV to be built by NPPD/WERE for 2010 in-service.
- Balanced Portfolio Projects<sup>5</sup>:
  - Anadarko 345/138/13.2kV Autotransformer
  - Woodward– TUO 345kV line
  - Iatan– Nashua 345kV line
  - Muskogee– Seminole 345kV line
  - Knoll– Axtell 345kV line
  - Spearville– Knoll 345kV line
  - Tap Stillwell – Swissvale 345kV line at West Gardner
- Priority Projects<sup>6</sup>:
  - Hitchland - Woodward double circuit 345kV
  - Woodward – Medicine Lodge double circuit 345kV
  - Spearville – Comanche double circuit 345kV
  - Comanche – Medicine Lodge double circuit 345kV
  - Medicine Lodge – Wichita double circuit 345kV
  - Medicine Lodge 345/138kV autotransformer

---

<sup>3</sup> Approved 230kV upgrades are based on SPP 2007 STEP. Upgrades may need to be re-evaluated in the system impact study.

<sup>4</sup> Approved based on an order of the Kansas Corporation Commission issued in Docket no. 07-WSEE-715-MIS

<sup>5</sup> Notice to Construct (NTC) issued June, 2009

<sup>6</sup> Notice to Construct (NTC) issued June, 2010. NTC for double circuit lines indicated that NTC may be revised at a later time to be built at a higher voltage.

**Contingent Upgrades** - The following facilities do not yet have approval. These facilities have been assigned to higher queued interconnection customers. These facilities have been included in the models for the FCS-2010-004 study and are assumed to be in service. The FCS-2010-004 Customers at this time do not have responsibility for these facilities but may later be assigned the cost of these facilities if higher queued customers terminate their GIA or withdraw from the interconnection queue. The FCS-2010-004 Customer Generation Facilities in service dates may need to be delayed until the completion of the following upgrades.

- Finney – Holcomb 345kV ckt #2 line assigned to GEN-2006-044 interconnection customer. This customer is currently in suspension<sup>7</sup>.
- Central Plains – Setab 115kV transmission line assigned to GEN-2007-013 interconnection customer.
- Spearville 345/230kV autotransformer #2 assigned to 1<sup>st</sup> Cluster Interconnection Customers (100% to GEN-2006-006)
- Grassland 230/115kV autotransformer #2 assigned to 1<sup>st</sup> Cluster Interconnection Customers (100% to GEN-2008-016)
- Spearville 230/115kV autotransformer #2 assigned to DISIS-2009-001-1 Interconnection Customers (100% to GEN-2008-079)
- Petersburg – Madison 115kV assigned to DISIS-2009-001-1 Interconnection Customers
- Judson Large – North Judson Large – Spearville Ckt #2 assigned to DISIS-2009-001-1 Interconnection Customers (100% to GEN-2008-079)
- GEN-2008-038 Tap – Barnsdall 138kV assigned to DISIS-2009-001-1 Interconnection Customers (100% to GEN-2008-038)
- Belden – Bloomfield 115kV assigned to DISIS-2009-001-1 Interconnection Customers
- Wheeler – Anadarko 345kV Ckt #1 assigned to DISIS-2010-001 Interconnection Customers
- Hitchland – Wheeler double circuit 345kV assigned to DISIS-2010-001 Interconnection Customers
- Madison County 230/115kV autotransformer #1 assigned to DISIS-2010-001 Interconnection Customers
- Norfolk – Madison County Tap 115kV Ckt #1 assigned to DISIS-2010-001 Interconnection Customers
- Washita – Anadarko 138kV Ckt #2 assigned to DISIS-2010-001 Interconnection Customers
- Knoll 345/230kV autotransformer #2 assigned to DISIS-2010-001 Interconnection Customers
- Mullergren – Rice County 230kV Ckt #1 assigned to DISIS-2010-001 Interconnection Customers
- Rice County 230/115kV autotransformer #1 assigned to DISIS-2010-001 Interconnection Customers
- Washita – Weatherford 138kV Ckt #1 assigned to DISIS-2010-001 Interconnection Customers
- GEN-2008-079 Tap – Spearville 115kV Ckt #1 assigned to DISIS-2010-001 Interconnection Customers
- Spearville 345/230kV autotransformer #3 assigned to DISIS-2010-001 Interconnection Customers

---

<sup>7</sup> Based on Facility Study Posting November 2008

**Potential Upgrades Not in the Base Case** - Any potential upgrades that do not have a Notification to Construct (NTC) to construct have not been included in the base case. These upgrades include any identified in the SPP Extra-High Voltage (EHV) overlay plan, or any other SPP planning study other than the upgrades listed above in the previous section.

**Regional Groupings** - The interconnection requests listed in Appendix A were grouped together in three different regional groups based on geographical and electrical impacts. These groupings are shown in Appendix C.

To determine interconnection impacts, three different dispatch variations of the spring base case models were developed to accommodate the regional groupings.

For each group, the various wind generating plants were modeled at 80% nameplate of maximum generation. The wind generating plants in the other areas were modeled at 20% nameplate of maximum generation. This process created three different scenarios with each group being studied at 80% nameplate rating. These projects were dispatched as Energy Resources with equal distribution across the SPP footprint. Certain projects that requested Network Resource Interconnection Service were dispatched in an additional analysis into the balancing authority of the interconnecting transmission owner. This method allowed for the identification of network constraints that were common to the regional groupings that could then in turn have the mitigating upgrade cost allocated throughout the entire cluster. Additionally, each wind interconnection request was studied as a stand alone project at 100% nameplate for certain analyses.

Peaking units were not dispatched in the 2011 spring model. To study peaking units' impacts, the 2016 summer peak model was chosen and peaking units were modeled at 100% of the nameplate rating and wind generating facilities were modeled at 10% of the nameplate rating.

---

## Identification of Network Constraints

---

The initial set of network constraints were found by using PTI MUST First Contingency Incremental Transfer Capability (FCITC) analysis on the entire cluster grouping dispatched at the various levels mentioned above. These constraints were then screened to determine if any of the generation interconnection requests had at least a 20% Distribution Factor (DF) upon the constraint. Constraints that measured at least a 20% DF from at least one interconnection request were considered for mitigation. Interconnection Requests that were being studied for Network Resource Interconnection Service were studied in the additional NRIS analysis to determine if any constraint had at least a 3% DF. If so, these constraints were considered for mitigation.

Identification of Electrically Isolated Groups and Requests – From the FCITC analysis, it was determined that some of the regional groups had no common impacts with the other groups. However, this determination may change as the Interconnection Customers depending upon the time at which the interconnection customers enter either the Preliminary Interconnection System Impact Study (PISIS) or the Definitive Interconnection System Impact Study (DISIS).

## Determination of Cost Allocated Network Upgrades

Cost Allocated Network Upgrades of wind generation interconnection requests were determined using the 2011 spring model. Cost Allocated Network Upgrades of peaking units was determined using the 2016 summer peak model. Once a determination of the required Network Upgrades was made, a powerflow model of the 2011 spring case was developed with all cost allocated Network Upgrades in-service. A MUST FCITC analysis was performed to determine the Power Transfer Distribution Factors (PTDF), a distribution factor with no contingency that each generation interconnection request had on each new upgrade. The impact each generation interconnection request had on each upgrade project was weighted by the size of each request. Finally the costs due by each request for a particular project were then determined by allocating the portion of each request's impact over the impact of all affecting requests.

For example, assume that there are three Generation Interconnection requests, X, Y, and Z that are responsible for the costs of Upgrade Project '1'. Given that their respective PTDF for the project have been determined, the cost allocation for Generation Interconnection request 'X' for Upgrade Project 1 is found by the following set of steps and formulas:

- Determine an Impact Factor on a given project for all responsible GI requests:

$$\text{Request X Impact Factor on Upgrade Project 1} = \text{PTDF}(\%)(X) * \text{MW}(X) = X_1$$

$$\text{Request Y Impact Factor on Upgrade Project 1} = \text{PTDF}(\%)(Y) * \text{MW}(Y) = Y_1$$

$$\text{Request Z Impact Factor on Upgrade Project 1} = \text{PTDF}(\%)(Z) * \text{MW}(Z) = Z_1$$

- Determine each request's Allocation of Cost for that particular project:

$$\text{Request X's Project 1 Cost Allocation} (\$) = \frac{\text{Network Upgrade Project 1 Cost} (\$) * X_1}{X_1 + Y_1 + Z_1}$$

- Repeat previous for each responsible GI request for each Project

The cost allocation of each needed Network Upgrade is determined by the size of each request and its impact on the given project. This allows for the most efficient and reasonable mechanism for sharing the costs of upgrades.

### **Credits for Amounts Advanced for Network Upgrades** - Interconnection

Customer shall be entitled to credits in accordance with Attachment Z1 of the SPP Tariff for any Network Upgrades including any tax gross-up or any other tax-related payments associated with the Network Upgrades, and not refunded to the Interconnection Customer.

## Interconnection Facilities

---

The requirement to interconnect the 350.2 MW of generation into the existing and proposed transmission systems in the affected areas of the SPP transmission footprint consist of the necessary cost allocated shared facilities listed in Appendix E with an approximate cost of \$119,000,000. Appendix E also includes Interconnection Facilities specific to each generation interconnection request.

Other Network Constraints in the AEPW, MIDW, OKGE, SPS, MIPU, NPPD, SUNC, SWPA, MKEC, WERE, and WFEC transmission systems that were identified that may be needed to deliver to load are listed in Appendix F. With a defined source and sink in a TSR, a list of Network Constraints will be refined and expanded to account for all Network Upgrade requirements.

A preliminary one-line drawing for each generation interconnection request are listed in Appendix D.

---

## Powerflow Analysis Methodology

---

The Southwest Power Pool (SPP) Criteria states that:

“The transmission system of the SPP region shall be planned and constructed so that the contingencies as set forth in the Criteria will meet the applicable *NERC Reliability Standards* for transmission planning. All MDWG power flow models shall be tested to verify compliance with the System Performance Standards from NERC Table 1 – Category A.”

The FCITC function of MUST was used to simulate single contingencies in portions or all of the modeled control areas of AEPW, EMDE, Grand River Dam Authority (GRDA), Kansas City Power & Light (KCPL), LES, MIDW, MIPU, NPPD, OPPD, OKGE, SPS, SUNC, WERE, WFEC and other control areas were applied and the resulting scenarios analyzed. This satisfies the “more probable” contingency testing criteria mandated by NERC and the SPP criteria.

## Powerflow Analysis

A powerflow analysis was conducted for each Interconnection Customer's facility using modified versions of the 2011 (spring, summer, and winter) peak models and the 2016 (summer and winter) peak models. The output of the Interconnection Customer's facility was offset in each model by a reduction in output of existing online SPP generation. This method allows the request to be studied as an Energy Resource (ER) Interconnection Request. The available seasonal models used were through the 2016 Winter Peak. Certain requests that requested Network Resource Interconnection Service (NRIS) had an additional analysis conducted for sinking the energy in the interconnecting Transmission Owner's balancing authority.

This analysis was conducted assuming that previous queued requests in the immediate area of these interconnect requests were in-service. The analysis of the each Customer's project indicates that additional criteria violations will occur on the AEPW, MIDW, MIPU, NPPD, OKGE, SPS, SUNC, SWPA, MKEC, WERE, and WFEC transmission systems under steady state and contingency conditions in the peak seasons.

The need for reactive compensation will be determined during the Interconnection System Impact Study. The need for reactive compensation will be based on the Interconnection Customer's choice of wind turbine make and manufacturer. Dynamic Stability studies performed as part of the System Impact Cluster Study will provide additional guidance as to whether the reactive compensation can be static or a portion must be dynamic (such as a SVC or STATCOM). It is possible that an SVC or STATCOM device will be required at the Customer facility because of FERC Order 661A Low Voltage Ride-Through Provisions (LVRT) which went into effect January 1, 2006. FERC Order 661A orders that wind farms stay on-line for 3-phase faults at the point of interconnection even if that requires the installation of a SVC or STATCOM device.

### **Spearville Area** - This study area contained 100.8 MW of interconnection requests.

Constraints were observed in the Judson Large area. To mitigate the issues observed, a third 115kV circuit from a new Spearville Greenfield substation to the North Dodge substation was added. In addition, a second Spearville 345/115kV autotransformer was added.

### **North Nebraska Area** - This group had 150.4 MW of requested generation. The major constraint in the North Nebraska area was noticed on the Ainsworth – Stuart – Atkinson – Emmet – O'Neill 115kV transmission line. To mitigate this constraint, a new transmission line must be constructed from Stuart to O'Neill and the existing transmission line will need to be rebuilt.

### **Southwest Nebraska Area** - This group had 99 MW of requested generation. A higher queued request, GEN-2010-047, is currently being studied in DISIS-2010-002. GEN-2010-047 triggered some of the upgrades in this area and will be cost allocated those upgrades in DISIS-2010-002. The major constraints in this area were overloads on the Harbine – GEN-2010-047 Tap – Beatrice 115kV line and the Fairbury – Harbine 115kV line. To mitigate these constraints the Harbine – GEN-2010-047 Tap – Beatrice 115kV line was rebuilt. In addition, a new 115kV transmission line from Beatrice Power Station – Crete substation will be needed (with related substation work) as well as a new 115kV line from GEN-2010-047 Tap – Beatrice Power Station.

---

## Conclusion

---

The minimum cost of interconnecting all of the interconnection requests included in the Feasibility Cluster Study is estimated at \$119,000,000 for the Allocated Network Upgrades and Transmission Owner Interconnection Facilities are listed in Appendix E. These costs do not include the cost of upgrades of other transmission facilities listed in Appendix F which are Network Constraints.

These interconnection costs do not include any cost of Network Upgrades determined to be required by AC powerflow, short circuit or transient stability analysis. These studies will be performed if the Interconnection Customer executes the appropriate Interconnection System Impact Study Agreement and provides the required data along with demonstration of Site Control and the appropriate deposit. At the time of the System Impact Cluster Study, a better determination of the interconnection facilities may be available.

The required interconnection costs listed in Appendix E, and other upgrades associated with Network Constraints do not include all costs associated with the deliverability of the energy to final customers. These costs are determined by separate studies if the Customer submits a Transmission Service Request (TSR) through SPP's Open Access Same Time Information System (OASIS) as required by Attachment Z1 of the SPP Open Access Transmission Tariff (OATT).

## **E: Cost Allocation per Interconnection Request**

### **GEN-2010-037**

| <b>Facility</b>  | <b>Cost</b>         |
|--|---------------------|
| Interconnection Costs  | \$6,000,000         |
| Greenfield – North Fort Dodge<br>Build approximately 20 miles of 115kV                                   | \$8,000,000         |
| Spearville 345/115/xxkV Transformer CKT 2<br>Install second 345/115/xxkV Transformer at Spearville 345kV | \$12,000,000        |
| <b>Current Study Total</b>   | <b>\$26,000,000</b> |

### **GEN-2010-039**

| <b>Facility</b>  | <b>Cost</b>         |
|--|---------------------|
| Interconnection Costs  | \$4,000,000         |
| Ainsworth – Stuart – Atkinson – Emmet - O'Neill<br>Rebuild approximately 65 miles of 115kV | \$35,000,000        |
| O'Neill North<br>Build new 115kV 5 breaker ring bus  | \$4,000,000         |
| Stuart – O'Neill North<br>Build approximately 30 miles of 115kV                            | \$15,000,000        |
| <b>Current Study Total</b>   | <b>\$58,000,000</b> |

### **GEN-2010-044 (Interconnection at Harbine)**

| <b>Facility</b>   | <b>Cost</b>         |
|---|---------------------|
| Interconnection Costs (Option A)<br>Harbine 115kV   | \$1,500,000         |
| Harbine – Beatrice Power Station – Crete<br>Build 15 miles of 115kV transmission line         | \$9,500,000         |
| Beatrice – GEN-2010-047 – Harbine<br>Rebuild approximately 14 miles of 115kV                  | \$7,000,000*        |
| Crete – GEN-2010-047<br>Build approximately 25 miles of 115kV and Crete 115kV substation work | \$14,000,000*       |
| <b>Current Study Total</b>  | <b>\$32,000,000</b> |

\*Tentatively assigned to GEN-2010-047 in DISIS-2010-002. Withdrawal of GEN-2010-047 will cause a restudy to be performed to determine the updated cost responsibilities of GEN-2010-044.

### **GEN-2010-044 (Interconnection at new station on Harbine-Beatrice)**

| <b>Facility</b>   | <b>Cost</b>         |
|---|---------------------|
| Interconnection Costs (Option B)<br>GEN-2010-047 115kV  | \$4,500,000*        |
| Harbine – Beatrice Power Station – Crete<br>Build 15 miles of 115kV transmission line         | \$9,500,000         |
| Beatrice – GEN-2010-047 – Harbine<br>Rebuild approximately 14 miles of 115kV                  | \$7,000,000*        |
| Crete – GEN-2010-047<br>Build approximately 25 miles of 115kV and Crete 115kV substation work | \$14,000,000*       |
| <b>Current Study Total</b>  | <b>\$35,000,000</b> |

\*Tentatively assigned to GEN-2010-047 in DISIS-2010-002. Withdrawal of GEN-2010-047 will cause a restudy to be performed to determine the updated cost responsibilities of GEN-2010-044.
