June 2013

Revision History

Date	Author	Change Description
6/10/2013	SPP	Facility Study Report Issued

Summary

Omaha Public Power District (OPPD) performed a detailed Facility Study at the request of Southwest Power Pool (SPP) for Generation Interconnection request GEN-2010-041 (10.5 MW/ Wind) located in Pawnee County, Nebraska. The originally proposed in-service date for GEN-2010-041 was December 31, 2011. Interconnection Service will require the Network Upgrades listed in the “Other Network Upgrades” section. The request for interconnection was placed with SPP in accordance with SPP’s Open Access Transmission Tariff, which covers new generation interconnections on SPP’s transmission system.

Phases of Interconnection Service

It is not expected that interconnection service will require phases however, interconnection service will not be available until all interconnection facilities and network upgrades can be placed in service.

Interconnection Customer Interconnection Facilities

The Interconnection Customer will be responsible for all of the transmission facilities connecting the customer owned substation to the Point of Interconnection (POI), at Omaha Public Power District (OPPD) owned 161kV bus at the Sub 1399 Substation. GEN-2010-041 will utilize the existing wind farm generator lead to Point of Interconnection (POI). The Interconnection Customer will also be responsible for any equipment located at the Customer substation necessary to maintain a power factor of 0.95 lagging to 0.95 leading at the POI.

Transmission Owner Interconnection Facilities and Non-Shared Network Upgrades

To allow interconnection the Transmission Owner will need to verify associated terminal equipment is acceptable for the addition of the Interconnection Customer’s Interconnection Facilities. At this time GEN-2010-041 is responsible for \$0.00 of Transmission Owner Interconnection Facilities and Non-Shared Network Upgrades.

Shared Network Upgrades

The Interconnection Customer was studied within the DISIS-2010-002 Impact Study. At this time, the Interconnection Customer is allocated \$0.00 for Shared Network Upgrades. If higher queued interconnection customers withdraw from the queue, suspend or terminate their GIA, restudies will have to be conducted to determine the Interconnection Customers’ allocation of Shared Network Upgrades. All studies have been conducted on the basis of higher queued interconnection requests and the upgrades associated with those higher queued interconnection requests being placed in service. At this time, the Interconnection Customer is allocated the following cost for Shared Network Upgrade:

Share Network Upgrade Description	Allocated Cost	Total Cost
None	\$0.00	\$0.00
Total	\$0.00	

Other Network Upgrades

Certain Other Network Upgrades are currently not the cost responsibility of the Customer but will be required for full Interconnection Service. No Other Network Upgrades are currently assigned to this request.

Depending upon the status of higher or equally queued customers, the Interconnection Customer's in-service date is at risk of being delayed or their Interconnection Service is at risk of being reduced until the in-service date of these Other Network Upgrades.

Conclusion

The Interconnection Customer is responsible for \$0.00 of Transmission Owner Interconnection Facilities and Non-Shared Network Upgrades. At this time, the Interconnection Customer is allocated \$0.00 for Shared Network Upgrades. After all Interconnection Facilities and Network Upgrades have been placed into service, Interconnection Service for 10.5 MW, as requested by GEN-2010-041, can be allowed. At this time the total allocation of costs assigned to GEN-2010-041 for Interconnection Service are estimated at \$0.00.

Executive Summary

A Customer has requested a Facility Study under the Southwest Power Pool (SPP) Open Access Transmission Tariff (OATT) for the purpose of a 10.5 MW addition to an existing 60 MW wind generating facility interconnected to substation 1399 161kV, in Richardson County, Nebraska within the Balancing Authority Area of Omaha Public Power District (OPPD). The existing 60 MW wind generating facility interconnected to substation 1399 161 kV is called the Flat Water Wind Farm. The generation interconnection request for the 10.5 MW addition is SPP Generation Interconnection request GEN-2010-041. The generation interconnection request indicates that the rated output of the addition will be provided by seven GE 1.5 MW wind turbines. The generation interconnection request also indicates that the connection between the additional wind turbines and substation 1399 will be provided by the same 161/34.5 kV transformer that provides the connection between the existing wind turbines and substation 1399.

A System Impact Study was performed by SPP which evaluated the request to interconnect the additional 10.5 MW of generation at S1399. Initially studied as Network Resource Interconnection Service (NRIS), the System Impact Study completed in January 2011 (DISIS-2010-002) identified a requirement for the addition of a second 161/69kV autotransformer at the Humboldt 161kV substation.

The Customer later modified their interconnection request for Energy Resource Interconnection Service (ERIS) only (NRIS was removed). A subsequent System Impact Study completed in July 2011 (DISIS-2010-002-1), indicated that no network upgrades were required to accommodate the additional generation capacity at the S1399.

Generating Facility – GEN-2010-041

Pursuant to the SPP OATT and at the request of SPP, OPPD has performed the following Facility Study to satisfy the Facility Study Agreement executed by the requesting customer for SPP Generation Interconnection request GEN-2010-041. This request is for a 10.5 MW addition to an existing 60 MW wind farm in Richardson County, Nebraska.

Contingency Analysis

A steady-state contingency analysis was performed to identify constraints to interconnecting the proposed generating facility addition to the transmission system in accordance with NERC TPL-001, 002 & 003 Standards using SPP ERIS and NRIS impact criteria. The incremental impact of the GEN-2010-041 project to individual facilities was evaluated by comparing the steady-state performance of the transmission system in 2012 winter/spring/summer peak, and 2017 winter/summer peak without and with the GEN-2010-041 project.

System Intact Conditions

No ERIS or NRIS thermal or voltage constraints were identified for TPL-001 NERC category A (system intact) conditions.

Single-Event Contingencies

No thermal or voltage ERIS constraints were identified for TPL-002 NERC category B (single contingency) or TPL-003 NERC category C (multiple contingency) single event conditions.

NRIS thermal constraints under single event NERC category B and C contingencies were identified and are listed below. Since the customer only requested ERIS, these constraints are not required to be mitigated but are provided as information for potential constraints that may be identified in a Delivery study:

- Humboldt-S975 161-69 kV transformer
- BPS Sub7 - Clatona 115 kV line
- G10-47T – Harbine 115kV line
- S1263 T1 161-69kV transformer
- Clarinda – Nodaway 161kV line

No voltage ERIS or NRIS constraints were identified for NERC category B or C single event contingencies.

Prior Outage Contingencies

Various prior outage / contingency combinations were evaluated to support evaluating system performance. Constraints identified in this analysis are not required to be mitigated per SPP ERIS or NRIS criteria; however, these constraints identify potential operating limitations which may occur during certain planned outage work on the system. Identified thermal constraints for the prior outage / contingency combinations are listed below.

- Kelly 161-115-13.8 kV transformer
- Kelly-Tecumseh Hill 161 kV line
- Humboldt T2 161-115 kV transformer
- Humboldt – Steiner 115kV line
- Beatrice - Steiner 115kV line
- Kelly-King Hill 115 kV
- Circleville – King Hill 115kV
- Auburn Tap-S975 69 kV line
- Humboldt-S975 161-69 kV transformer

- Knob Hill – G09-40T 115kV
- BPS Sub7 - Clatona 115 kV line
- Midian 161-138 kV transformer
- Clatona – Sheldon 115kV line
- WM Bros – Midian 161kV line
- Tecumseh hill – WM Bros 161kV line
- G10-47T – Harbine 115kV line
- Clarinda – Nodaway 161kV line
- S1263 T1 161-69kV transformer

Mitigation Plans

The steady-state contingency analysis did not identify any ERIS constraints; therefore, there are not any required ERIS mitigation projects. There were some NRIS constraints and prior outage constraints. Potential mitigation plans for these NRIS and prior outage constraints are provided for informational purposes but are not required to accommodate the customer’s ERIS request.

NRIS & Prior Outage Constraints

There were five (5) NRIS thermal constraints identified for single event contingency conditions and eighteen (18) thermal constraints identified for prior outage contingency conditions. Potential mitigation plans for all of these constraints have been identified and are presented below:

Single-Event Contingency Interconnection Constraints

Additional 161/69 kV transformer capacity in the Southeast OPPD area could be added to mitigate the overloads of the OPPD Humboldt-S975 161/69 kV T4 transformer and the OPPD S1263 T1 161-69kV transformer.

Line re-conductor projects or line rebuilds could be used as mitigation options for the NPPD BPS Sub - Clatona 115 kV line, NPPD G10-47T – Harbine 115kV line and MIPU Clarinda – Nodaway 161kV line overloading issues.

Prior Outage Contingency Interconnection Constraints

All of the impacted facilities identified in the prior outage contingency analysis were significantly affected by the GEN-2010-041 wind facility during prior outage conditions. In real-time operations when the problematic prior outage conditions listed in this report occur, the GEN-2010-041 wind facility may be subject to output restrictions by an amount sufficient to mitigate its impacts on the impacted facilities listed above.

Short Circuit Analysis & Results

OPPD, NPPD, and Westar each performed an evaluation to determine whether any of their circuit breakers would not have adequate interrupting capability with the GEN-2010-041 project based on short-circuit results for a transmission-system topology of all branches in service. This review by OPPD, NPPD and Westar uncovered no breakers whose interrupting capability would potentially be inadequate.

Power Factor Correction

The SPP System Impact Study completed in July 2011 (DISIS-2010-002-1) established the final power factor requirement at the point of interconnection (S1399) for GEN-2010-041 to be 0.965 leading/lagging.

The existing 60 MW wind farm and 10.5 MW addition both share the same 161/34.5 kV generator step-up transformer (GSU) which is rated for 75 MVA. It is assumed that the 60 MW and 10.5 MW wind turbines have a 0.9 leading/lagging power factor capability. For this assumption the maximum MVA output capability of the combined wind farm is 78.3 MVA. If approximately 1.8 MVA is attributed to losses between the turbines and the 34.5 kV bus, then there is a potential to overload the existing 161/34.5 kV GSU by 102% (76.5 MVA).

For conditions when the total wind farm generation output is at its maximum MVA generating capability and is producing reactive power to support voltage at S1399, there is a potential to overload the 161/34.5 kV GSU. This was observed in OPPD sensitivity studies where the voltage schedule was adjusted for GEN-2010-041. This issue can be mitigated by reducing the voltage schedule at S1399.

Metering and Communication

The wind farm developer for GEN-2010-041 will be required to adhere to OPPD metering and communication requirements in order to separate this 10.5 MW addition from OPPD's existing 60 MW portion of the combined 70.5 MW wind generating facility. The details of the metering and communication requirements will be addressed in the generation interconnection agreement (GIA) for GEN-2010-041.

Conclusion

This report presents the results of steady-state contingency analysis and short-circuit analysis performed to evaluate the interconnection impacts of the GEN-2010-041 wind facility in accordance with NERC TPL-001, 002 & 003 Standards using SPP ERIS and NRIS impact criteria. There are not any constraints or associated mitigation requirements to accommodate the customer's ERIS request. There were some constraints identified for the NRIS evaluation and for prior outage conditions. Potential mitigation plans for these NRIS and prior outage constraints were identified and provided for information. The wind farm developer for GEN-2010-041 will be required to adhere to OPPD metering and communication requirements in order to separate the 10.5 MW addition from

OPPD's existing 60 MW portion of the combined 70.5 MW wind generating facility. Metering and communication requirements will be outlined in the GIA for GEN-2010-041.

1. Introduction

A Facilities Study has been performed to evaluate the interconnection of a 10.5 MW addition to an existing 60 MW wind generating facility interconnected to substation 1399 161kV, in Richardson County, Nebraska within the Balancing Authority Area of Omaha Public Power District (OPPD). The existing 60 MW wind generating facility interconnected to substation 1399 161 kV is called the Flat Water Wind Farm. The generation interconnection request for the 10.5 MW addition is SPP Generation Interconnection request GEN-2010-041. The generation interconnection request indicates that the rated output of the addition will be provided by seven GE 1.5 MW wind turbines. The generation interconnection request also indicates that the connection between the additional wind turbines and substation 1399 will be provided by the same 161/34.5 kV transformer that provides the connection between the existing wind turbines and substation 1399.

A System Impact Study was performed by SPP which evaluated the request to interconnect the additional 10.5 MW of generation at S1399. Initially studied as Network Resource Interconnection Service (NRIS), the System Impact Study completed in January 2011 (DISIS-2010-002) identified a requirement for the addition of a second 161/69kV autotransformer at the Humboldt 161kV substation.

The Customer later modified their interconnection request for Energy Resource Interconnection Service (ERIS) only (NRIS was removed). A subsequent System Impact Study completed in July 2011 (DISIS-2010-002-1), indicated that no network upgrades were required to accommodate the additional generation capacity at the S1399.

The Interconnection Customer has requested the 10.5 MW wind generating facility be evaluated as an ERIS request which has been considered for this assessment. The Interconnection Customer will be responsible for its 161/34.5kV substation that will contain its step down transformers and wind turbine collector feeders.

This Facility Study has the following objectives:

- Identify constraints to interconnection of the proposed wind generating facility;
- Identify network upgrades needed to support interconnection of the proposed wind generating facility;
- Document the impact of the proposed wind generating facility on branch loading, bus voltages and system stability;
- Document equipment short-circuit duties in a report for submittal to Affected Systems

This study was performed by OPPD with consideration to queued generation interconnection projects in the local area near the point of interconnection. The report will present the results of steady-state contingency and short-circuit analyses.

2. Description of Requests

The Interconnection Customer has requested to interconnect a 10.5 MW wind generating facility to the OPPD transmission system. The customer proposes to interconnect at S1399 161kV located approximately 10 miles south of the Humboldt substation on the Humboldt – Kelly 161 kV line. The customer has also requested the 10.5 MW wind generating facility be evaluated as an ERIS request.

Figure 2-1: Geographic Location of the GEN-2010-041 Point of Interconnection

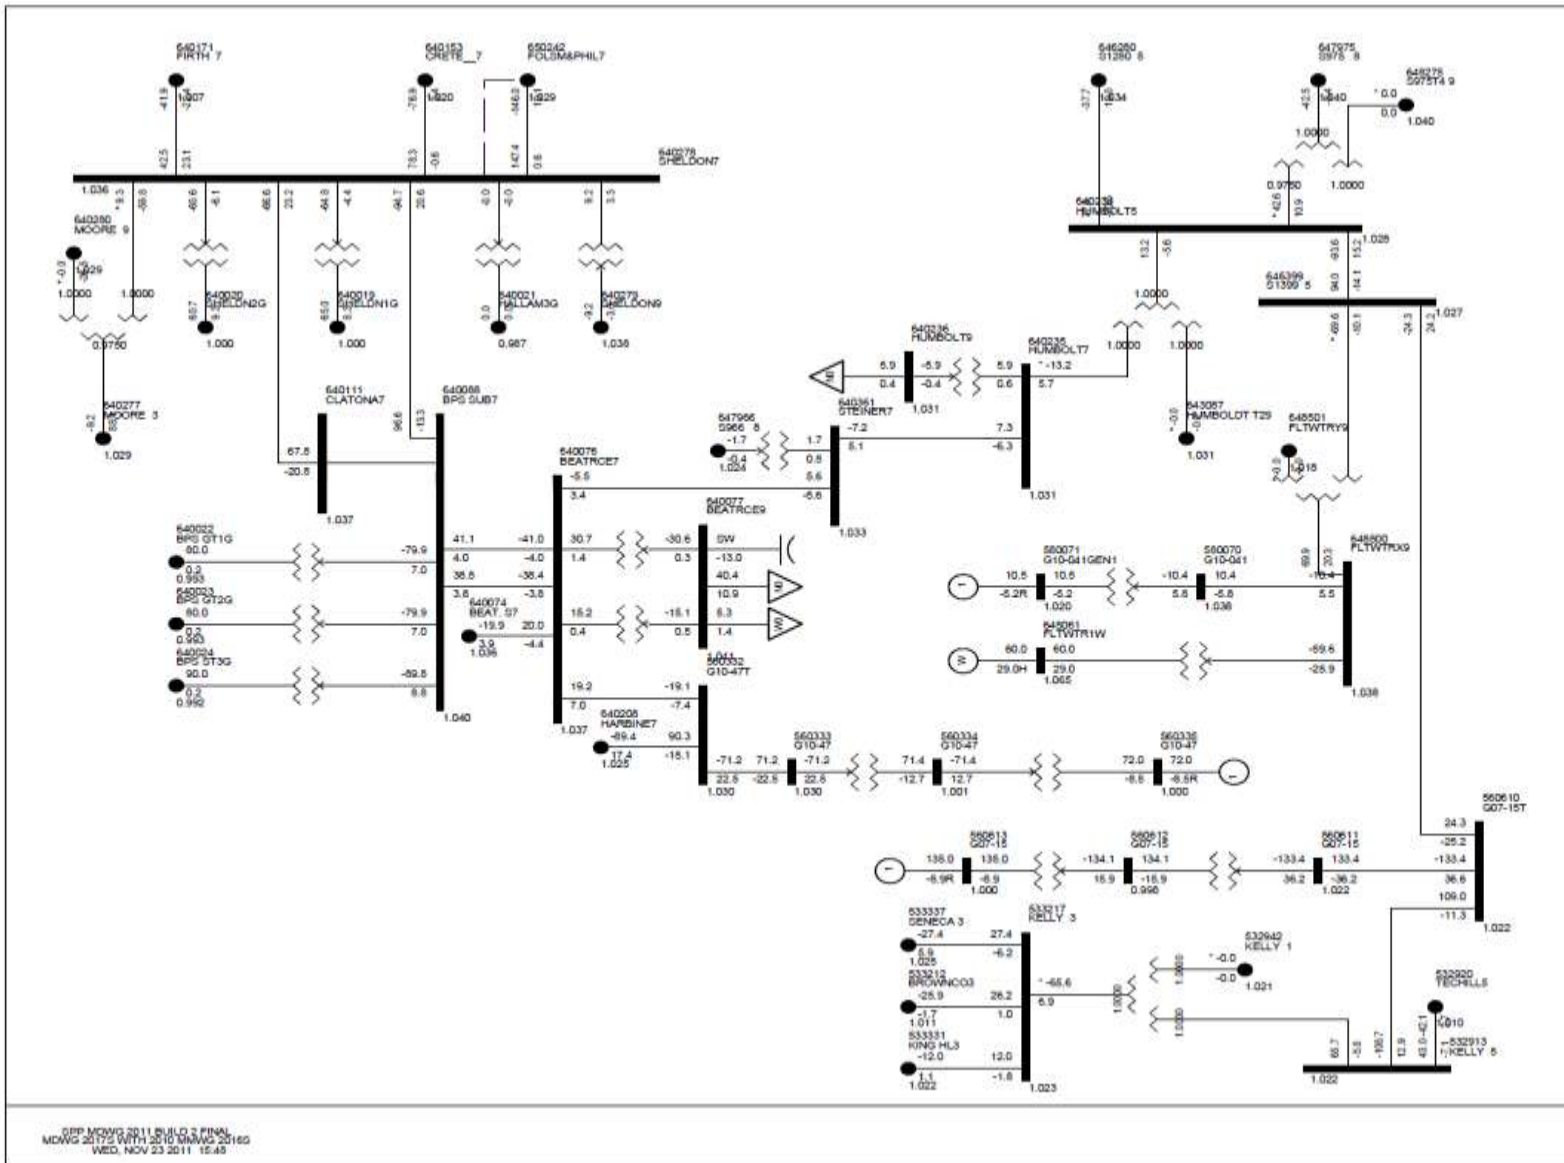

Figure 2-2: OPP GEN-2010-041 Interconnection One-Line Diagram

The GEN-2010-041 project has a rated output of 10.5 MW provided by 7 GE 1.5MW wind turbines. The generating facility is modeled using one equivalent generator connected as shown in Figure 2-3. The powerflow modeling data used in this study to model the wind farms in the SPP interconnection queue was obtained from SPP.

The GEN-2010-041 wind farm model and parameters are documented in Section B.1 of Appendix B.

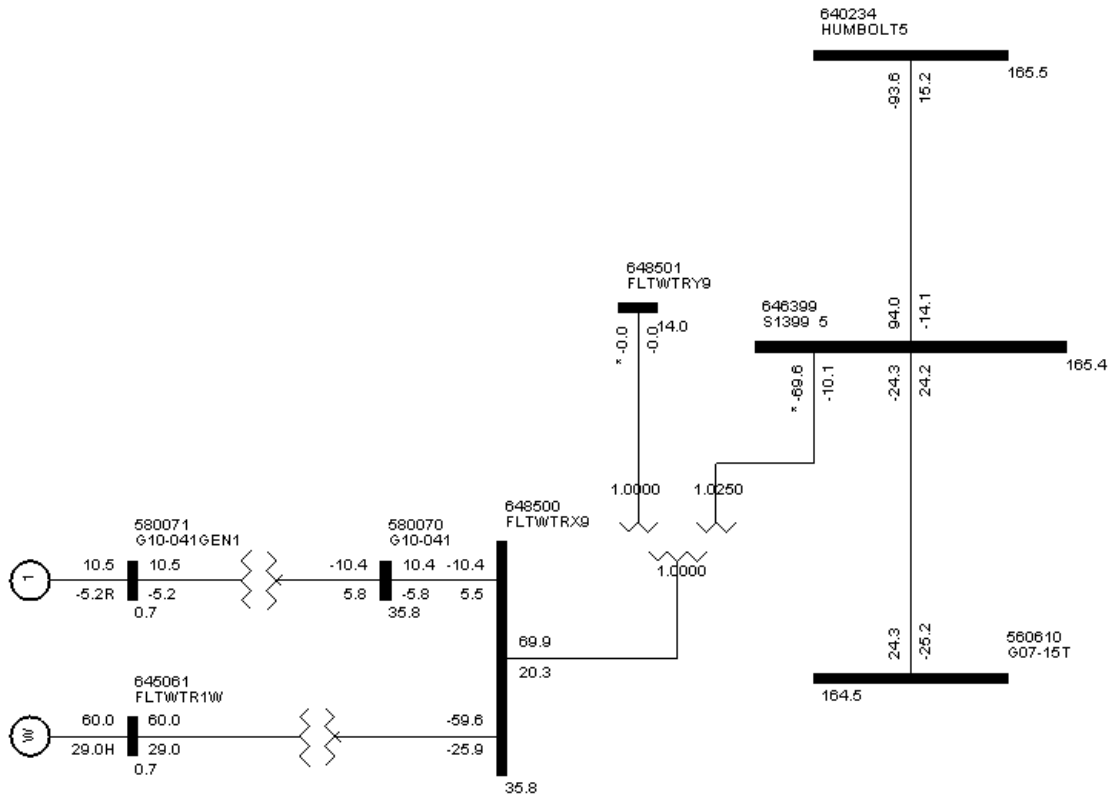

Figure 2-3: GEN-2010-041 Conceptual One-Line Diagram

3. Steady State Analysis

3.1. Computer Programs

Steady-state analysis was performed using PSS®E version 30.3.2.

3.2. Methodology

Benchmark cases representing system conditions in 2012 winter/spring/summer peak, and 2017 winter/summer peak were created without the GEN-2010-041 project. Study cases were created by adding the GEN-2010-041 project and dispatching the generating facility at 10.5 MW. Nonlinear (AC) contingency analysis was performed on both the benchmark and study cases and the incremental impact of the GEN-2010-041 project was evaluated by comparing flows and voltages without and with the proposed interconnection.

3.3. Model Development

3.3.1. Benchmark Cases

The SPP MDWG 2011 model series includes models representing winter peak conditions in 2012 and 2017, spring peak conditions in 2012 and summer peak conditions in 2012 and 2017. Benchmark cases without the GEN-2010-041 project were developed from the MDWG models by applying the model updates provided by SPP, OPD or local Balancing Authorities (BA).

The benchmark cases include relevant prior queued generating facilities, which are listed in Appendix A.1. The following generating facilities are within the geographic area of the GEN-2010-041 point of interconnection and are dispatched as follows:

- ASGI-2010-001 (AECI) - 100% of 400 MW
- ASGI-2010-005 (AECI) - 100% of 99 MW
- ASGI-2010-009 (AECI) - 100% of 201 MW
- GEN-2006-014 (MIPU) - 100% of 300 MW
- GEN-2006-017 (MIPU) - 100% of 300 MW
- GEN-2007-015 (WERE) - 100% of 135 MW
- GEN-2007-017 (MIPU) - 100% of 100.5 MW
- GEN-2007-053 (MIPU) - 100% of 110 MW
- GEN-2010-041 (OPPD) - 100% of 10.5 MW
- GEN-2010-047 (NPPD) - 100% of 72 MW

- GEN-2009-040 (WERE) - 100% of 73.8 MW
- J133 (MEC) - 100% of 100.5 MW
- R26 (MEC) - 100% of 400 MW

It should be noted that the conditions utilized for the steady state study represent worst-case generation outlet conditions. This was done to stress generator outlet capacity at the maximum accredited generation for the study cluster. Since all prior queued projects were modeled at 100% of their nameplate rating, thermal loading contributions to facilities created by these projects is possible but unlikely.

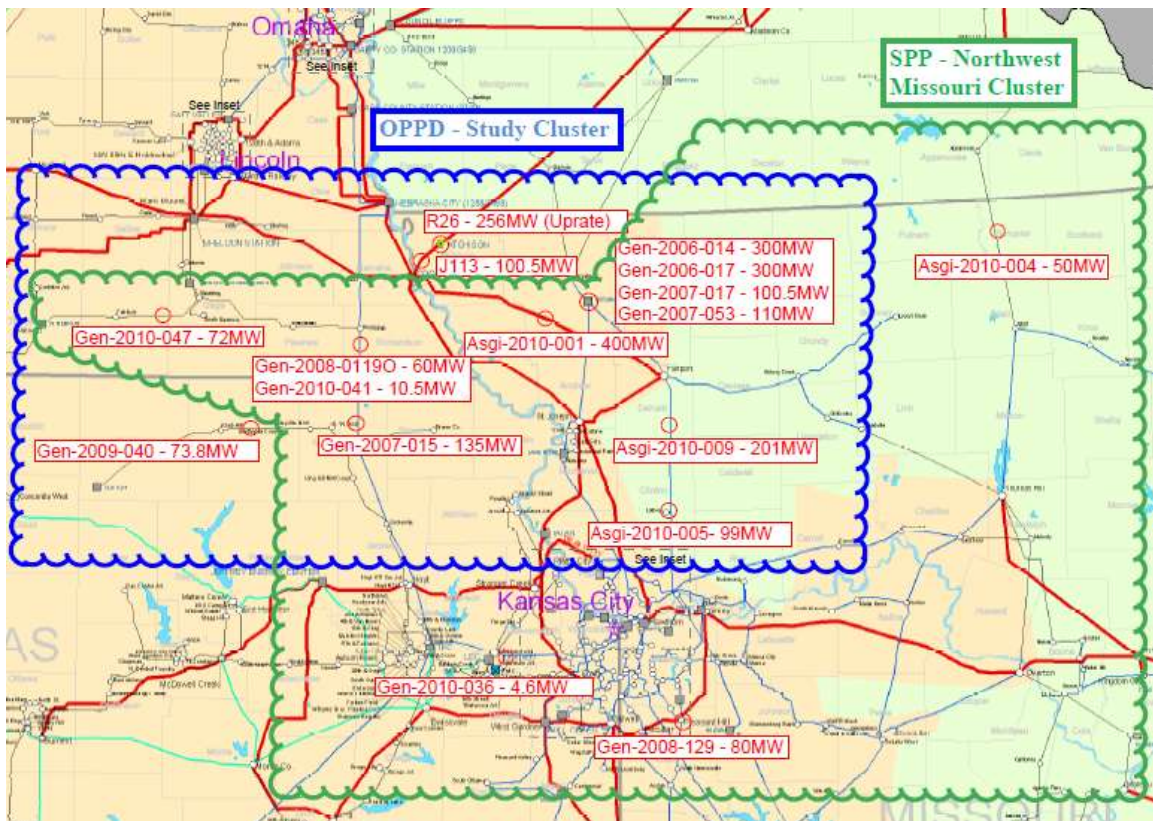

Figure 3-1: GEN-2010-041 OPPD Study Cluster

Cases were solved with transformer tap adjustment enabled, area interchange disabled, phase shifter adjustment enabled and switched shunt adjustment enabled.

3.3.2. Study Request Cases

The GEN-2010-041 generating facility was added to each benchmark case as described in Section 2. The generating facility was dispatched to OPPD generators outside of the geographic area that are in service. Dispatch details are provided in Section B.1 of Appendix B, Tables B-1 through B-5.

3.4. Contingency Criteria

A variety of contingencies were considered for steady-state analysis:

- NERC Category A with system intact (no contingencies)
- NERC Category B
 - Single element outages, at buses with a nominal voltage of 100 kV and above, in the following areas: ALTW (area 627), LES (area 650), MEC (area 635), NPPD (area 640), OPPD (area 645), WAPA (zone 1604 and buses 652603 & 631069), WERE (area 536), KCPL (area 541), MIPU (area 540), AECI (area 330)
 - Single element outages, at all buses in the OPPD (area 645) control area
 - Multi-element outages initiated by a fault with normal clearing such as multi-terminal lines, in and around OPPD's area
- NERC Category C
 - Any two circuits of a common tower line, in and around OPPD's area
 - Selected bus section and breaker failure contingencies in and around OPPD's area
 - Selected prior outages near the point of interconnection followed by category B contingencies or single event category C contingencies.

For all contingency and post-disturbance analyses, cases were solved with transformer tap adjustment disabled (fixed), area interchange adjustment disabled, phase shifter adjustment disabled (fixed) and switched shunt adjustment disabled (fixed).

Prior outages were selected to produce more severe system impacts. Analysis considered the prior outages listed below.

- S1399 – Humboldt 161 kV line
- GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line
- Humboldt – S1280 161 kV line
- S975 (Humboldt) T4 161/69 kV transformer

3.5. Monitored Elements

The study area is defined in Table 3-1. Facilities in the study area were monitored for system intact and contingency conditions. Under NERC category A, B and C conditions branches were monitored for loading above the normal (PSS®E rate A) rating as shown in the column labeled "Contingency Thermal Limits".

Table 3-1: Monitored Elements

Area	Monitored Facilities	Contingency Thermal Limits	Bus Voltage Limits
ALTW	100 kV and above	100% of Rate A	1.05/0.95
LES	100 kV and above	100% of Rate A	1.05/0.95
MEC	100 kV and above	100% of Rate A	1.05/0.95
NPPD	100 kV and above	100% of Rate A	1.05/0.95
OPPD	69 kV and above	100% of Rate A	1.05/0.95
WAPA	Zone 1604 and buses 652603 & 631069	100% of Rate A	1.05/0.95
WERE	100 kV and above	100% of Rate A	1.05/0.95
KCPL	100 kV and above	100% of Rate A	1.05/0.95
MIPU	100 kV and above	100% of Rate A	1.05/0.95
AECI	100 kV and above	100% of Rate A	1.05/0.95

3.6. Reliability Margins

All system elements were monitored using 100% of the applicable normal rating.

3.7. Performance Criteria

A branch is considered a significantly affected facility (SAF) if both of the following conditions are met:

- 1) The branch is loaded above its applicable normal or emergency rating for the post-change case.
- 2) The distribution factor is greater than 3% for NRIS or greater than 20% for ERIS.

For non-linear contingency analysis, distribution factors are calculated as follows:
Project MW

$$DF = 100 \times \frac{MVA \text{ flow with Project} - MVA \text{ flow (w/o Project)}}{Project MW}$$

A voltage impact is considered significant if both of the following conditions are met; all significant voltage impacts must be resolved before a project can receive interconnection service.

- 1) The bus voltage is outside of applicable normal or emergency limits for the

- post-change case.
- 2) The change in bus voltage is greater than 0.01 per unit.

3.8. Contingency Analysis Results

The incremental impact of the proposed interconnection on individual facilities was evaluated by comparing flows and voltages without and with the project. Analysis was performed using PSS®E activity ACCC.

3.8.1. System Intact Conditions

No significant thermal or voltage impacts were identified for NERC category A (pre-contingency) conditions.

3.8.2. Single Event Contingencies

The results in this section are for analysis of conditions following NERC Category B contingencies and Category C contingencies with a single initiating event such as a breaker failure or a fault on any two circuits of a multiple circuit towerline.

3.8.2.1. Thermal Impacts

No thermal ERIS constraints were identified for TPL-002 NERC category B (single contingency) or TPL-003 NERC category C (multiple contingency) single event conditions.

There were thermal NRIS constraints which are listed below and in Appendix C, Tables C-1, C-2, C-3, C-4 and C-5. The highest loading of each facility on which the GEN-2010-041 project has a significant thermal impact is shown in Table 3-2.

The facilities listed below are considered NRIS constraints for the GEN-2010-041 project:

- Humboldt-S975 161-69 kV transformer
- BPS Sub - Clatona 115 kV line
- G10-47T – Harbine 115kV line
- S1263 T1 161-69kV transformer
- Clarinda – Nodaway 161kV line

The Humboldt-S975 161-69 kV transformer is an NRIS constraint and is a significantly affected facility in the 2012 and 2017 summer and winter cases. The transformer loading exceeds the 67.2 MVA rating for two category B and two category C contingencies. The highest loading is approximately 83.4 MVA (124.1% of 67.2 MVA rating) for the failure of a 161 kV circuit breaker at bus S1263.

The BPS Sub-Clatona 115 kV line is an NRIS constraint and is a significantly affected facility in the 2012 winter and spring and 2017 winter cases. The line loading exceeds the 137 MVA rating for one category B contingency. The highest loading is approximately 141.4 MVA (103.2% of 137 MVA rating) when BPS Sub-Sheldon 115 kV line is out of service.

The G10-47T-Harbine 115 kV line is an NRIS constraint and is a significantly affected facility in the 2012 summer case. The line loading exceeds the 99 MVA rating for one category B contingency. The highest loading is approximately 102.2 MVA (103.2% of 99 MVA normal rating) when the Kelly – Gen-2007-015 161 kV line is out of service.

The S1263 T1 161-69kV transformer is an NRIS constraint and is a significantly affected facility in the 2012 and 2017 winter cases. The line loading exceeds the 106 MVA rating for one category B contingency and one category C contingency. The highest loading is approximately 111.9 MVA (105.6% of 106 MVA rating) for the loss of the Humboldt-S975 161-69kV transformer.

The Clarinda – Nodaway 161 kV line is an NRIS constraint and is a significantly affected facility in the 2012 summer, winter and spring and 2017 summer and winter cases. The line loading exceeds the 167 MVA rating for various category B and C contingencies. The highest loading is approximately 310.1 MVA (185.7 % of 167 MVA rating) when the Maryville – Creston 161 kV line is out of service.

3.8.2.2. Voltage Impacts

No voltage ERIS or NRIS constraints were identified following NERC Category B contingencies or Category C contingencies with a single initiating event.

Table 3-2: Thermal Violations, Single-Event Contingencies, Maximum Screened Loading

Monitored Element	Rating MVA	Pre-Project Loading (%)	Post-Project Loading (%)	DF (%)	Contingency	Type	Case

3.8.3. Prior Outage Contingencies

Constraints identified in this section are not required to be mitigated per SPP ERIS or NRIS criteria; however, these constraints identify potential operating limitations which may occur during certain planned outage work on the system.

The results in this Section are for analysis of the following conditions:

- In each season case, under the selected prior outage (Category B) condition, subsequent category B and single event category C contingencies are applied

3.8.3.1. Thermal Impacts for Prior Outage Contingencies

There were thermal constraints which are listed below and in Appendix C, Tables C-6, and C-7. The highest loading of each facility on which the GEN-2010-041 project has a significant thermal impact is shown in Table 3-3.

The GEN-2010-041 project has a significant impact on the facilities listed.

- Kelly 161-115-13.8 kV transformer
- Kelly-Tecumseh Hill 161 kV line
- Humboldt T2 161-115 kV transformer
- Humboldt – Steiner 115kV line
- Beatrice - Steiner 115kV line
- Kelly-King Hill 115 kV
- Circleville – King Hill 115kV
- Auburn Tap-S975 69 kV line
- Humboldt-S975 161-69 kV transformer
- Knob Hill – G09-40T 115kV
- BPS Sub7 - Clatona 115 kV line
- Midian 161-138 kV transformer
- Clatona – Sheldon 115 kV line
- WM Bros – Midian 161kV line
- Tecumseh hill – WM Bros 161kV line
- G10-47T – Harbine 115kV line
- Clarinda – Nodaway 161kV line
- S1263 T1 161-69kV transformer

The Kelly 161-115-13.8 kV transformer is a significantly affected facility in the 2012 spring and summer cases. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1399-Humboldt 161 kV line. The highest loading is approximately 203.6 MVA (121.2% of the 168 MVA rating) when the S1399 - Humboldt 161 kV line and Kelly-Tecumseh Hill 161 kV line are both out of service.

The Kelly-Tecumseh Hill 161 kV line is a significantly affected facility in the 2012 spring and summer cases. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1399-Humboldt 161 kV line. The highest loading is approximately 204.5 MVA (127% of the 161 MVA rating) when the S1399 - Humboldt 161 kV line and Kelly 161-115-13.8 kV transformer are both out of service.

The Humboldt T2 161-115-13.8 kV transformer is a significantly affected facility in the 2012 spring and summer cases. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line. The highest loading is approximately 202.1 MVA (160.4% of the 126 MVA rating) when the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line is out and for the failure of a 161 kV circuit breaker at Humboldt.

The Humboldt-Steiner 115 kV line is a significantly affected facility in the 2012 spring and summer cases. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line. The highest loading is approximately 199.2 MVA (166% of the 120 MVA rating) when the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line is out and for the failure of a 161 kV circuit breaker at Humboldt.

The Beatrice-Steiner 115 kV line is a significantly affected facility in the 2012 spring and summer cases. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line. The highest loading is approximately 200.3 MVA (166.9% of the 120 MVA rating) when the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line is out and for the failure of a 161 kV circuit breaker at Humboldt.

The Kelly-King Hill 115 kV line is a significantly affected facility in the 2012 spring and summer case. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1399-Humboldt 161 kV line. The highest loading is approximately 119.1 MVA (129.5% of the 92 MVA rating) when the S1399 - Humboldt 161 kV line and Kelly-Tecumseh Hill 161 kV line are both out of service.

The Circleville-King Hill 115 kV line is a significantly affected facility in the 2012 spring and summer case. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1399-Humboldt 161 kV line. The highest loading is approximately 117.1 MVA (127.3% of the 92 MVA rating) when the S1399 - Humboldt 161 kV line and Kelly-Tecumseh Hill 161 kV line are both out of service.

The Auburn Tap-S975 69 kV line is a significantly affected facility in the 2012 spring and summer cases. Impacts violate performance criteria for two prior outage/contingency pairs involving prior outage of the Humboldt-S1280 or S1399-Kelly 161 kV lines. The highest loading is approximately 93.6 MVA (130% of the 72 MVA rating) when the

S1399-Kelly 161 kV line is out and for the failure of a 161 kV circuit breaker at S1280 161 kV.

The Humboldt-S975 161-69 kV transformer is a significantly affected facility in the 2012 spring and summer cases. Impacts violate performance criteria for two prior outage/contingency pairs involving prior outage of the Humboldt-S1280 or S1399-Kelly 161 kV lines. The highest loading is approximately 112.9 MVA (168% of the 67.2 MVA rating) when the S1399-Kelly 161 kV line is out and for the failure of a 161 kV circuit breaker at S1280 161 kV.

The Knob Hill- G09-40T 115 kV line is a significantly affected facility in the 2012 spring and summer case. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1399-Humboldt 161 kV line. The highest loading is approximately 106 MVA (115.2% of the 92 MVA rating) when the S1399 - Humboldt 161 kV line and Kelly-Tecumseh Hill 161 kV line are both out of service.

The BPS Sub- Clatona 115 kV line is a significantly affected facility in the 2012 spring case. Impacts violate performance criteria for four prior outage/contingency pairs involving prior outage of the S1399 – Humboldt 161 kV line, GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line, Humboldt – S1280 161 kV line or the S975 (Humboldt) T4 161/69 kV transformer. The highest loading is approximately 149.6 MVA (109.2% of the 137 MVA rating) when the S1280 - Humboldt 161 kV line and BPS Sub-Sheldon 115 kV line are both out of service.

The Midian 161-138-12.47 kV transformer is significantly affected facility in the 2012 spring case. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1399-Kelly 161 kV line. The highest loading is approximately 91.5 MVA (115.8% of the 79 MVA rating) when the S1399-Kelly 161 kV line and Empec-Wichita 345kV are both out of service.

The Clatona – Sheldon 115kV line is significantly affected facility in the 2012 spring case. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1280-Humboldt 161 kV line. The highest loading is approximately 143.6 MVA (104.8% of the 137 MVA rating) when the S1280-Humboldt 161 kV line and BPS Sub-Sheldon 115 kV line are both out of service.

The WM Bros – Midian 161kV line is significantly affected facility in the 2012 spring case. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1399-Humboldt 161 kV line. The highest loading is approximately 93.2 MVA (110.9% of the 84 MVA rating) when the S1399-Humboldt 161 kV line and JEC N-Summit 345 kV line are both out of service.

The Tecumseh hill – WM Bros 161kV line is significantly affected facility in the 2012 spring case. Impacts violate performance criteria for one prior outage/contingency pair involving prior outage of the S1399-Humboldt 161 kV line. The highest loading is

approximately 96.4 MVA (114.8% of the 84 MVA rating) when the S1399-Humboldt 161 kV line and Empec-Wichita 345kV are both out of service.

The G10-47T- Harbine 115 kV line is a significantly affected facility in the 2012 spring and summer case. Impacts violate performance criteria for three prior outage/contingency pairs involving prior outage of the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line, Humboldt – S1280 161 kV line or the S975 (Humboldt) T4 161/69 kV transformer. The highest loading is approximately 129 MVA (130.3% of the 99 MVA rating) when the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line is out and for failure of a 161 kV circuit breaker at Humboldt.

The Clarinda – Nodaway 161kV line is a significantly affected facility in the 2012 spring and summer cases. Impacts violate performance criteria for four prior outage/contingency pairs involving prior outage of the S1399 – Humboldt 161 kV line, GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line, Humboldt – S1280 161 kV line or the S975 (Humboldt) T4 161/69 kV transformer. The highest loading is approximately 415.5 MVA (271.6% of the 153 MVA rating) when the S1399 - Humboldt 161 kV line and Maryville - Nodaway 161kV line are both out of service.

The S1263 T1 161-69kV transformer is a significantly affected facility in the 2012 summer case. Impacts violate performance criteria for two prior outage/contingency pairs involving prior outage of the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line or the S975 (Humboldt) T4 161/69 kV transformer. The highest loading is approximately 115 MVA (108.5% of the 106 MVA rating) when the GEN-2007-015 Nemaha Wind Facility – Kelly 161 kV line and Humboldt-S975 161-69 kV transformer are both out of service.

3.8.3.2. Voltage Impacts for Prior Outage Contingencies

No significant voltage impacts were identified following NERC Category B contingencies or Category C contingencies with a single initiating event.

4. Short Circuit Study

4.1 Computer Programs

Short-Circuit analyses was performed using PSS®E version 30.3.2.

4.2 Methodology

Analysis was performed using PSS®E activity ANSI, which calculates fault currents according to the ANSI/IEEE Standard C37.5-1979. The following assumptions were made during execution of activity ANSI:

- Maximum operating voltage is 1.05 pu
- Transformer impedance correction was not applied to zero-sequence transformer impedances
- For branches and machines with a zero value of resistance in the positive or zero sequence network, the zero value was replaced with a non-zero resistance equal to the positive or zero sequence reactance divided by a scaling factor. A scaling factor of 83 for branches and a factor of 252 for machines were used.
- The fault-current multiplying factors include the effects of dc decrement only
- Reactance is used to determine short-circuit current magnitudes (E/X calculation)
- Contact parting times are the minimum parting times shown in Figure 10 of IEEE Standard C37.010-1999, i.e., three-cycle contact parting time for 5-cycle breaker, two-cycle contact parting time for 3-cycle breaker, and 1.5-cycle contact parting time for 2-cycle breaker.

For both three-phase and single-line-to-ground faults, activity ANSI calculates the symmetrical fault current, the X/R ratio as specified in ANSI/IEEE Standard C37.5-1979 and IEEE Standard C37.010-1999, and the fault-current multiplying factor from ANSI/IEEE Standard C37.5-1979 for determining the adequacy of the interrupting capability of breakers rated on a total current basis. Fault-current multiplying factors for determining the adequacy of the interrupting capability of breakers rated on a symmetrical current basis are not calculated by the activity and were determined external to PSS®E from IEEE Standard C37.010-1999.

Results were produced for a transmission-system topology of all branches in service for all buses within the OPPD area and all buses seven or fewer buses away from the GEN-2010-041 Point of Interconnection. Results were distributed to companies in whose area in the models there was at least one bus with an increase caused by the GEN-2010-041 project of more than 2 amps in the maximum between three-phase and single-line-to-ground faults of the product of the symmetrical fault current and either of the two types of fault-current multiplying factors described above. These companies and OPPD then each performed an evaluation to determine whether any of their circuit breakers would not have adequate interrupting capability based on the results for a transmission-system

topology of all branches in service. For any such breakers, more-detailed analysis would then be performed to determine the actual interrupting duty of those breakers based on the configuration of the substation in which they are located.

For the OPPD system, only circuit breakers at a nominal voltage level of 69 kV or higher were evaluated. Adequacy of the interrupting capability of each OPPD circuit breaker was determined by multiplying the symmetrical fault current seen by the breaker by the appropriate fault-current multiplying factor and comparing the result with the breaker's interrupting rating reduced for reclosing service as appropriate.

4.3 Short-Circuit Model

OPPD started with a short circuit model that consisted of the “Study Case” short circuit model used in the short circuit analysis for the existing Flat Water wind farm with various updates applied. From this starting model OPPD developed two cases: a benchmark case without the GEN-2010-041 wind farm project and a change case which included the GEN-2010-041 wind farm project. The only difference between the benchmark case and the change case was the inclusion of the GEN-2010-041 wind farm project in the change case.

Benchmark case short circuit model:

- *04sc_final_m3_SPPv303_gen_on_nc2_May_19_updth_GI4_Cooper_jpmx_FWbase_r1.sav*
 - Model Updates:
 - Updated Flat Water bus numbers and names
 - Updated Flat Water 161/34.5kV step-up transformer MVA base and positive sequence impedance.
 - Updated existing Flat Water MBASE
 - Updated existing Flat Water turbine combined step-up transformer positive and zero sequence impedance.

Change case short circuit model – (Contains Flat Water 10.5 MW Uprate):

- *04sc_final_m3_SPPv303_gen_on_nc2_May_19_updth_GI4_Cooper_jpmx_FW10.5MWuprate_r1.sav*
 - Model Updates:
 - Includes updates from the benchmark case short circuit model
 - Added GEN-2010-041

The request for interconnection indicated that the GEN-2010-041 project would consist of the addition of seven GE 1.5-MW wind turbines. The developer of the GEN-2010-041 project subsequently indicated to OPPD that the type of wind turbines that would be added would be GE 1.85-MW wind turbines. Accordingly, the model parameters that were used in this study for the GEN-2010-041 project represent the addition of seven GE

1.85-MW wind turbines.

A one-line diagram showing how the GEN-2010-041 project was modeled is shown in Figure 4-1. The model parameters used in this study for the existing Flat Water wind farm and the GEN-2010-041 project are documented in Section B.2 of Appendix B.

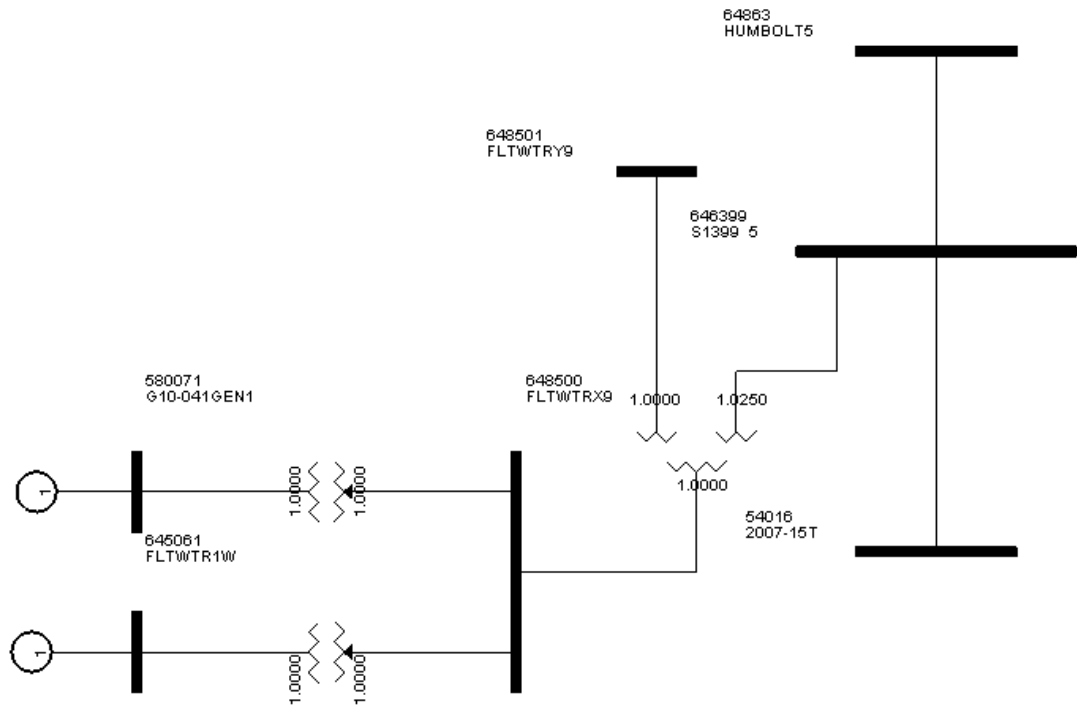

Figure 4-1: GEN-2010-041 - One-Line Diagram

4.5 Results

Interrupting devices were checked at substations seven or fewer buses away from the GEN-2010-041 Point of Interconnection (S1399 161 kV).

Results from the benchmark case and the change case for the product of symmetrical fault current and the appropriate multiplying factor from the ANSI/IEEE standards for a transmission-system topology of all branches in service are shown in Appendix D. Results are shown for breakers with Rated Interrupting Times of 2, 3 and 5 cycles for all buses seven or fewer buses away from the Point of Interconnection of the GEN-2010-041 project. For the OPPD area, results are also shown for buses more than seven buses away from the Point of Interconnection of the GEN-2010-041 project. The currents in the tables of Appendix D are the higher of the currents for either three-phase or single-line-to-ground faults.

The NPPD and Westar areas are the only non-OPPD areas having at least one bus with a value for “Fault Current Increase” in Appendix D of more than 2 amps. These companies and OPPD each performed an evaluation to determine whether any of their circuit breakers would not have adequate interrupting capability based on the results for a transmission-system topology of all branches in service. The review by OPPD, NPPD and Westar of the results for a transmission-system topology of all branches in service uncovered no breakers whose interrupting capability would potentially be inadequate.

5. Mitigation Plans

The short circuit analysis did not identify that any equipment upgrades were required; therefore, there are not any required short circuit mitigation projects. The steady-state contingency analysis did not identify any ERIS constraints; therefore, there are not any required ERIS mitigation projects. There were some NRIS constraints and prior outage constraints. Potential mitigation plans for these NRIS and prior outage constraints are provided for informational purposes but are not required to accommodate the customer's ERIS request. Mitigation plans for some of these constraints have been identified and are presented in this section.

5.1. NRIS and Prior Outage Related Constraints

The steady-state contingency analysis identified five (5) NRIS thermal constraints for single event contingency conditions and eighteen (18) thermal constraints for prior outage contingency conditions. Mitigation plans for these constraints have been identified and are presented below:

5.1.1. Single-Event Contingency Interconnection Constraints

- Humboldt-S975 161-69 kV transformer
- BPS Sub - Clatona 115 kV line
- G10-47T – Harbine 115kV line
- S1263 T1 161-69kV transformer
- Clarinda – Nodaway 161kV line

The OPPD Humboldt-S975 161/69 kV T4 transformer had a worst case post-contingency loading of 124.1% of the 67.2 MVA rating in the case with the GEN-2010-041 wind project. Additional 161/69 kV transformer capacity could be added to mitigate the overload of the OPPD Humboldt-S975 161/69 kV T4 transformer. Single event-contingency analysis was performed with the addition of a second 67.2 MVA transformer. The analysis demonstrated that this facility upgrade mitigated all post-contingent loading issues on the Humboldt-S975 161/69 kV transformer and also demonstrated that no additional facility loading issues were created. Adding additional 161/69 kV transformer capacity at Humboldt will mitigate the GEN-2010-041 wind project's impacts on this transformer loading.

The BPS Sub - Clatona 115 kV line had a worst case post-contingency loading of 103.2% of the 137 MVA rating in the case with GEN-2010-041 wind project. Loading of this facility is significantly impacted by the max generation output at NPPD's Beatrice Power Station and prior queued wind facilities GEN-2010-047 and GEN-2007-015. Westar wind facility GEN-2007-015 is currently on suspension; the outcome of this facility may affect mitigation plans for this facility. Mitigation might involve line re-conductor

projects or line rebuilds or attentive generation dispatch.

The G10-47T – Harbine 115kV line had a worst case post-contingency loading of 103.2% of the 99 MVA rating in the case with GEN-2010-041 wind project. Loading of this facility is significantly impacted by the max generation output at NPPD’s Beatrice Power Station and prior queued wind facilities GEN-2010-047 and GEN-2007-015. Westar wind facility GEN-2007-015 is currently on suspension; the outcome of this facility may affect mitigation plans for this facility. Mitigation might involve line re-conductor projects or line rebuilds or attentive generation dispatch.

The S1263 T1 161-69kV transformer had a worst case post-contingency loading of 105.6% of the 106 MVA rating in the case with the GEN-2010-041 wind facility. Additional 161/69 kV transformer capacity at Humboldt substation could be added to mitigate the overload of the S1263 T1 161-69kV transformer. Single event-contingency analysis was performed with the addition of a second 67.2 MVA transformer. The analysis demonstrated that this facility upgrade mitigated all post-contingent loading issues on the S1263 T1 161-69kV transformer and also demonstrated that no additional facility loading issues were created. Adding additional 161/69 kV transformer capacity at Humboldt will mitigate the GEN-2010-041 wind project’s impacts on this transformer loading.

The Clarinda – Nodaway 161kV line had a worst case post-contingency loading of 185.7% of the 167 MVA rating in the case with the GEN-2010-041 wind project. Further analysis on this line loading revealed that there is a worst case post-contingent overload of 255.4% in the Benchmark case without the GEN-2010-041 wind project. This worst case post-contingency loading of 255.4% in the Benchmark case is for a different single event contingency (loss of Nodaway-Maryville 161 kV). Loading of this facility is significantly impacted by the max generation output from three prior queued MIPU wind facilities which are on suspension: GEN-2006-014, GEN-2006-017 and GEN-2007-017. These results have shown that the Clarinda – Nodaway 161kV post-contingent loading issue is a pre-existing issue regardless of the GEN-2010-041 wind facility interconnection. Subsequent to MIPU determining mitigation plans for this pre-existing loading issue, the Customer could work with MIPU to determine if any mitigation is required of the GEN-2010-041 wind project.

5.1.2. Prior Outage Contingency Interconnection Constraints

- Kelly 161-115-13.8 kV transformer
- Kelly-Tecumseh Hill 161 kV line
- Humboldt T2 161-115 kV transformer
- Humboldt – Steiner 115kV line
- Beatrice - Steiner 115kV line
- Kelly-King Hill 115 kV
- Circleville – King Hill 115kV
- Auburn Tap-S975 69 kV line

- Humboldt-S975 161-69 kV transformer
- Knob Hill – G09-40T 115kV
- BPS Sub7 - Clatona 115 kV line
- Midian 161-138 kV transformer
- Clatona – Sheldon 115 kV line
- WM Bros – Midian 161kV line
- Tecumseh hill – WM Bros 161kV line
- G10-47T – Harbine 115kV line
- Clarinda – Nodaway 161kV line
- S1263 T1 161-69kV transformer

All of these impacted facilities were significantly affected by the GEN-2010-041 wind project during prior outage conditions. In real-time operations when the problematic prior outage conditions listed in this report occur, the GEN-2010-041 wind facility could be subject to output restrictions by an amount sufficient to mitigate its impacts on the impacted facilities listed above.

6. Power Factor Correction

The SPP System Impact Study completed in July 2011 (DISIS-2010-002-1) established the final power factor requirement at the point of interconnection (S1399) for GEN-2010-041 to be 0.965 leading/lagging.

The existing 60 MW wind farm and 10.5 MW addition both share the same 161/34.5 kV generator step-up transformer (GSU) which is rated for 75 MVA. It is assumed that the 60 MW and 10.5 MW wind turbines have a 0.9 leading/lagging power factor capability. For this assumption the maximum MVA output capability of the combined wind farm is 78.3 MVA. If approximately 1.8 MVA is attributed to losses between the turbines and the 34.5 kV bus, then there is a potential to overload the existing 161/34.5 kV GSU by 102% (76.5 MVA).

For conditions when the total wind farm generation output is at its maximum MVA generating capability and is producing reactive power to support voltage at S1399, there is a potential to overload the 161/34.5 kV GSU. This was observed in OPPD sensitivity studies where the voltage schedule was adjusted for GEN-2010-041. This issue can be mitigated by reducing the voltage schedule at S1399.

7. Metering and Communication

The wind farm developer for GEN-2010-041 will be required to adhere to OPPD metering and communication requirements in order to separate this 10.5 MW addition from OPPD's existing 60 MW portion of the combined 70.5 MW wind generating facility. The details of the metering and communication requirements will be addressed in the generation interconnection agreement (GIA) for GEN-2010-041.

8. Conclusion

This report presents the results of steady-state contingency analysis and short-circuit analysis performed to evaluate the interconnection impacts of the GEN-2010-041 wind facility in accordance with NERC TPL-001, 002 & 003 Standards using SPP ERIS and NRIS impact criteria. There are not any constraints or associated mitigation requirements to accommodate the customer's ERIS request. There were some constraints identified for the NRIS evaluation and for prior outage conditions. Potential mitigation plans for these NRIS and prior outage constraints were identified and provided for information. The wind farm developer for GEN-2010-041 will be required to adhere to OPPD metering and communication requirements in order to separate the 10.5 MW addition from OPPD's existing 60 MW portion of the combined 70.5 MW wind generating facility. Metering and communication requirements will be outlined in the GIA for GEN-2010-041.

Appendix A. Model Development for Steady-State Analysis

A.1 Generation Projects

The following projects were added to the MDWG 2011 series models and dispatched as shown in Table A-1:

Table A-1: Generation Projects

Request	Amount (MW)	Area	Sink	Proposed Point of Interconnection (POI)
ASGI-2010-001	400	AECI	SPP	Tap Cooper – Fairport 345kV
ASGI-2010-005	99	AECI	SPP	Lathrop 161kV
ASGI-2010-009	201	AECI	SPP	Osborn 161kV
GEN-2006-014	300	MIPU	SPP	Tap Maryville – Clarinda 161kV & Tie to Midway 161kV
GEN-2006-017	300	MIPU	SPP	Tap Maryville – Clarinda 161kV & Tie to Midway 161kV
GEN-2007-015	135	WERE	SPP	Tap Humboldt – Kelly 161kV
GEN-2007-017	100.5	MIPU	SPP	Tap Maryville – Clarinda 161kV & Tie to Midway 161kV
GEN-2007-053	110	MIPU	SPP	Tap Maryville – Clarinda 161kV & Tie to Midway 161kV
GEN-2010-041	10.5	OPPD	OPPD	S1399 161kV
GEN-2010-047	72	NPPD	SPP	Tap Beatrice – Harbine 115kV
GEN-2009-040	73.8	WERE	SPP	Tap Smittyville – Knob Hill 115kV
J133	100.5	MEC	SPP	Cooper – Atchison 345 kV
R26	400	MEC	SPP	256 MW uprate of existing Atchison wind farm
